Source record: 50593

Yep - you identified the difference... The Alinco doesn't come with a mic.

I own one, and it has worked well for the past couple years. It is a good radio for packet, and it the price is right. If you are looking for a packet radio, this one is a good choice.

73, Drew

2. Options for Macintosh tcp/ip?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-01-01 04:11:13 UTC
From: ewing@capstan.cis.yale.edu
Message-ID: <1994Jan1.041113.24950@news.yale.edu>
Source record: 50594

Hello and happy new year!

I am using Net/Mac (2.3.31, now) and it generally works for me. I can think of quite a few potential improvements, however. What is the state of alternative Mac tcp/ip implementations for ax.25? Is there a mailing list or other source of information on work that may be in progress?

Features I'd like to see (not an exhaustive list!):

-Use of MacTCP with LocalTalk, EtherTalk, InterSLIP transport or what have you. (Discussed here previously. This could be done with an ax.25 driver module, but one really wants to be a router driving multiple interfaces. Would hate to have to buy Apple's pricey router s/w.)

-Modularity: Separate terminal emulation, ftp, finger "clients", etc. A modular approach would allow mixing & matching s/w from various authors. (Like our present mailers.)

-Mac look&feel - scrollable windows (like common terminal emulators), cut & paste, etc.

-Apple events & scripting support.

(your favorite stuff here.)

Thanks for any pointers.

Martin, AA6E

[Stuff Deleted]

It seems to me, that what someone needs to do is to write a Comm. Toolbax
connection tool, sort of like MacSlip or MacPPP, that links MacTCP
to a TNC. Perhaps it could be called MacKISS or the like.

The we could use all of the great existing Macintosh TCP-IP tools such
as Eudora, Telnet, Fetch, etc. over TCP-IP Packet.

Perhaps the timing problems are insurmountable -- I wish I were a savvy enough Mac programmer to attempt it myself.

Any comments from those more knowledgeable?

4. Re: Looking for information

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-01-01 07:28:00 UTC
From: ebo@algodones.unm.edu
Message-ID: <2g38m0INN61v@lynx.unm.edu>
Source record: 50596

I gues that I only have one thing to add:

The most difficult thing that I have ever had to learn is how to
ask the right question.

Or mabe put another way, when begining a new field I often
haven't a clue where to start looking or how to phrase the
question in a precise enough way that anybody but me can
understand. Every field, technical or otherwise, is so full of
jargon that until you learn the rudiments, the etiquette, etc.
you cannot even begin... You are correct, that many people
are lazy, but where does a newby begin? Do remenber what it was
like trying to ask questions of an expert when you were a rank
novice still wet behind the key?

>situation, and it is desirable, if not outright necessary, that it support
>the AX.25 mob).

Depends on what you mean by a 'straight' ax.25 connection.
If you mean, does it allow ax.25 users to directly connect to it, and
digipeat via it, then yes it does. If you mean, does it allow users
to user ax/ip encapsulation, then no, I don't htink it does.

Message-ID: <9401022117.AA06871@ingersoll.com>
Source record: 50606

```
Someone recently asked if the Gracilis Packeten can do ax25.
The answer is yes.
My station regularly connects to a neigboring Packeten node over ax25.
-In fact, most users access the Packetens around here via ax25.
The Packeten basically runs NOS (heavily modified).
The base protocols that NOS does, the Packeten also does.

10. What kind of FSK is this?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-01-03 04:33:23 UTC
From: acsys@crl.com
Message-ID: <2g876j$qgs@crl.crl.com>
Source record: 50604

I've got several digital signals receivable on my fm cable that I'm trying to decode, I've identified one of the frequencies used as 1270Hz. Does anyone know if any commonly used FSK formats use 1270Hz as one of there frequencies?

Also what about using a computer to decode FSK? you could sample an i/o line and find the time between transisions of the tone to determine the frequncy. Maybe have a programmable frequency point where the output would be 1 if above that point and 0 if below. Anyone thought about this? It seems to me one could be made very simply with a pic micro. comments?

thanx,

mycal

[Author was Laurent Cas]
[Posted on Mon, 3 Jan 1994 09:49:03 GMT]

Hi,

1-I own a RCI 2950 radio CB and I would like to modify it so I could
control it with a computer. I need plans to add a RS232C to the RCI
or someone help for the right way to do it. Can somebody help ?

2- Does anybody know a FTP site where I could FTP modifications files
or plans ?

3- Does someone knows the meaning of the 6 mike pins for the RCI 2950 ?

Thanks for replies.

Cheers, Laurent.

Source record: 50608

Charles:

I would get the 1989 proceedings of the ARRL computer networking conference.
This is the one that occurred in Columbia, Md. (I may have the year wrong).

In it, Eric Scace, K3NA, has done a nice job of writing in a state diagramatic
language which is easy to understand, a `flow chart' of AX.25. I have found
it trivial to program a quick and easy AX.25 after reading this. An efficient
one requires more work as always but this will really get you started. It
is really easy since this is basically a `flow chart' of the actions
required to events and you could take these things as objects and encode them
in some object oriented language or whatever. I recommend it strongly
as compared to the AX.25 specs which I always thought were just awful.

Standard narrow-shift RTTY uses 1275/1445Hz

This has already been done.... various 'simple interface' RTTY programs
exsit which simply square up the incoming signal and time the intervals
between zero-crossings to determine the frequency. It doesn't work too well
in the presence of noise if the noise can cause false zero crossings.

The Bell 202 format uses 1200 Hz as Mark, and the CCITT(now ITU-T)
V.23 format uses 1300 Hz for Mark.

In Bell 202, Space is 2200 Hz, in V.23, Space is 2100 Hz. Do you
see either of these frequencies ?

Macintosh Amateur Radio Software - January 1994
Version 1.05

First of all... Happy New Year to all of you Mac Hams. Hope Santa was good to you and you have a neat new toy or two!

Please feel free to distribute this list as widely as possible. Many of you have asked if it is OK to cross-post this list? I don't mind, but I would like to know where it is going. If you think it should be cross-posted to other USENET groups, please let me know so I can try and manage these. We don't want to have any duplication or our welcome will be wore out!

Those of you that can tell me about ANY of these programs compatibility with System 7 would be appreciated! I am going to be adding a System 7 compatability section to EACH description in future releases. If the application is KNOWN to execute properly under System 7, the System 7 anotation will be placed as the last line of the product description. More clarification on levels of System 7 compatibility in the future editions... but this is a start!

Some of the information in this list was gleaned from flyers supplied by the software vendors, or in some cases from reviews in amateur radio publications or the README files included with the archive. Some of the information has not been verified for a long time; please check with the vendors/authors for the latest product specs, pricing, etc.

NEW/CHANGES: I've started adding more version numbers so that our users will know if they have the most current release. Thanks to those that have already sent them in... I'll accept all corrections!

This list contains info on updated for several applications: updated information on Kantronic's Host Master(thanks John-WD1V) and Lar's newest release of Morse Trainer 1.1.1. Ivo-ON1XK and Adam-PA2AGA both contnue to be busy with new releases of IM/Mac and NET/Mac repsectively. I know that Adam made changes to support the multiport serial boards... and now we can have up to 16 TNCs connected! Thanks Adam, Ivo and Lars for some great products!

MacSPOC is the most recent new entry

I have been informed that The World, world.std.com, is the newest site carrying the Mac Ham Radio Software. Scott-WY1Z is maintaining these file as the Librarian of the Boston Amateur Radio Club. Look in the following path: /pub/hamradio/mac. Check at the bottom of this list for more information on ftp'able sites carrying Amateur Radio software. The ARRL ListServer is also carrying the latest

version of this list... in case you loose this one!

*** Collections ***
<MacNet v5.31>
Join MacNet and get included in the latest version of "Macnet Roster", a HyperCard 2.x stack that now has > 400 members and is the proverbial "Who's Who" of hams using Macs. You'll find "Macnet Roster" a great tool for finding out who, what and how other hams are using their Macs with their ham stations. It even includes this file!
Send $30.00($40.00 DX) check or money order to: WD1V, John Seney, 144 Pepperidge Drive Manchester, NH 03103 USA.
All disks shipped First Class Mail PPd. Get the COMPLETE Macnet Software Collection ppd. on 10 disks!
Based on your interests, you'll also receive public domain shareware received by our members.
System 7

<Project Mac>
Contest logging, antenna design, satellite tracking, clip art, etc. Microsoft BASIC required for many of the programs. Most of this software is now available in the MacNet collection. Send three formatted 800K Macintosh disks with stamped, self-addressed disk mailer to Stan Horzepa, WA1LOU, One Glen Ave., Wolcott, CT 06716-1442. Stan can be reached at horzepa@gdc.com
NOTE: Stan has indicated much of this software is "old" and may not work on some newer Macs. Also he notes that most of his collection is available in the MacNet collection above. He will send anyone what he has if you send him the disks and SAS mailer.

<Amateur Radio Software for Macintosh>
Extensive catalog including logging, Morse code, gray line, test preparation, satellite tracking, contesting, and packet radio programs.
ZCo Corporation, P.O. Box 3720, Nashua, NH 03061. NOTE: This company has been rumored to be out of business!

<Amateur Radio #1>
Contains satellite tracking, Morse code, attenuator design, and Ohm's law calculator programs. Kinetic Designs, P.O. Box 1646, Orange Park, FL 32067.

*** Test preparation ***
<Ham Test Stacks>
HyperCard stacks containing the entire question pool for each license class. Can be used for preparation or generating actual tests. The current releases are: Novice v4.1(new questions eff. 7/1/93), Technician v4.0(new questions effective 7/1/93), General v2.4, Advanced v2.4, Extra v2.4 If you wish to receive these PUBLIC DOMAIN stacks, please send a SASE (self addressed STAMPED envelope - 2 ounces postage = .52) and 800K diskette to the author: Diana L. Carlson, 3 Spruce Street, Hudson, NH 03051. Diana will no longer

send out the stacks unless the envelope has sufficient postage
for return mail (in general, that means .52-.98, depending on size
of envelope) and for those who send a standard business envelope,
she takes no responsibility for the condition of the diskette
through US mail. Available via anonymous FTP from various sites,
including uxc.cso.uiuc.edu (/pub/ham-radio). NOTE: The newest
releases of Novice and Technician stacks are available at
uxc.cso.uiuc.edu (5/6/93) Author is available via Internet:
dls@genrad.com
System 7 savy with HyperCard 2.1

<MacHam>
Test generators and study aids for the Technician, General,
Advanced, and Extra class written elements. Includes the complete
question pool for each license. Hypercard based.
Coyne Co., P.O. Box 2000-200, Mission Viejo, CA 92692.
System 7 with HyperCard 2.1

*** Morse code practice ***
<N6MZV Morse Trainer>
Lets you practice any combination of letters, numbers, and/or
punctuation characters. Can send user-created text files.
RT Martin, N6MZV, 10382 Orange Avenue, Cupertino, CA 95014. Also
available via anonymous FTP from ftp.apple.com (/pub/ham-radio).
Shareware.

<Morse Code Tutor v1.6> - used to be called Morse Tutor
Sends random groups of letters, numbers, and/or punctuation
characters. Available via anonymous FTP from ftp.apple.com
(/pub/ham-radio). Or send formatted 800K Macintosh disk with
stamped, self-addressed return disk mailer to Jack Brindle, WA4FIB,
726-175th Street SW, Bothell, WA 98012; Compuserve: 73365,606.

<MorseMania V1.0>
Designed for those already familiar with Morse code who want to
improve their speed. Allows code practice at various speeds and
audio pitches. Can generate random sequences or play the contents
of user-created text files. Freeware. Available via anonymous
FTP from whirlwind.stanford.edu (/pub). Contact Edward Plumer,
KM6IQ, for more information; Internet: plumer@isl.stanford.edu.

<MacMorse>
Randomly sends chosen characters. Lets you create your own practice
files. David A. Kall, 700 Marine Parkway #314, New Port Richey,
FL 34652.

<MacMorse v1.3>
MacMorse is designed to help you learn Morse code and improve your
receiving speed. It has several ways that it can send letters and
punctuation. Shareware. Doug Havenhill, Dynamics and Control,
7143 West Sunnyside Drive, Peoria, AZ 85345.

<MacSamuel>
Sends random words, random character groups, and user-created text files. Can also create simulated QSOs with randomly generated text and callsigns. Avant Systems, P.O. Box 5437, Pittsburgh, PA 15206.

<Zihua Morse>
Designed to teach Morse code to beginners and to improve the accuracy and speed of advanced users. Responses can be typed into the computer; the program will calculate accuracy and timing statistics for each session. Optional speech synthesizer reads the characters out loud for an accuracy check. Zihua, P.O. Box 51601, Pacific Grove, CA 93950.

<Sparks-II v2.0.5>
More Code training program. Available for anonymous ftp at rahul.net /pub/davidj/radio

<Morse Master v1.0>
The newest of the morse code training programs. MM calculates the real speed as follows: Real speed = Number of Words/end time - start time. And the lengh of word is generating randomly, so if you set even 5WPM, sometimes another value will appear. However you should believe the slidebutton's value. If you repeat many times, the average speed should be 5WPM (if not... anyway, believe the slidebutton's value). Archive is available mac.archive.umich.edu, path: mac/util/organization/morsemaster1.0.sit.hqx The author can be reached thru the following e-mail addresses: h79261a@kyu-cc.cc.kyushu-u.ac.jp. (Eiji AOL account is no longer valid - moved back to Japan after his studies.)

<Morse Trainer-US v1.1.1>
MorseTrainer is a powerful tool for learning and training Morse code. Features: Three different training modes: user text, random text, library text; Arbitrary signal pitch and timbre; Arbitrary speed and tempo; Multi-alphabet support; Random text generator; Text library editor; On-line alphabet; On-line manual; Help Balloons; And a lot more. New features in 1.1: Enhanced sound generator, volume control and risetime control. The pitch is set in steps of 10Hz instead of using MIDI frequencies; Speed and tempo limits increased to 80 words/minute as a result of the enhanced sound generator; User-selectable font in the Misc settings dialog. FREEWARE!
This version uses TrueType fonts instead on bitmaps fonts so that the user can distinguish 0(zero) from O(character). Furthermore speed and tempo can be given in either characters/minute or words/minute. Archive is available mac.archive.umich.edu, path: mac/util/organization/ Author is available via internet: sund@tde.lth.se
System 7 savy

<CW Speed Builder v3.0>
This program is for improving Morse Code (CW) reception skill. The major difference between this and other Morse Code training

programs is that this one will not continue sending until you
provide the correct answer. Major changes which have been suggested
and implemented since last version include: after three incorrect
responses the program shows the correct character; the list of
characters at the end which will show those you know and those
you need more practice on; the frequency of the tone has been
changed; volume of the tone has been reduced; the character " - "
has been added (dah dit dit dit dah) Comments can be sent as
follows: America Online:K7UPJ, Internet:k7upj@aol.com, Packet
radio:K7UPJ@KA3T, Compu$erv:70521,2356, Mail:Box 84, Cascade, MD
21719

*** Packet and other digital modes ***
<NET/Mac 2.3.34>
Allows simultaneous TCP/IP, AX.25, and NET/ROM connections. Requires a TNC
with KISS mode. Copyright, but free for noncommercial use. The latest
releases have added support of multi-port serial boards like AE's QuadraLink.
It is now possible to have up to 16 TNCs connected up to a Nubus Mac!
Adam van Gaalen, PA2AGA, (Internet: adam@IGG.TNO.NL) has been making the
modifications to NET/Mac. This version (and others) is available via
anonymous FTP from ucsd.edu (/hamradio/packet/tcpip/incoming),
mac.archive.umich.edu and
System 7

<Domain-to-Hosts Converter 1.0r3>
This application will create a hosts.net file from the domain.txt file that
PC owners use with NOS. Created by Ken-NS1C is available on many TCP/IP
packet switches in New England.program.
System 7

<IM/Mac 1.0b27w>
Mailer program for use with the SMTP protocol. Alternative to the BM program
that comes with NET/Mac. Written by Ivo van Ursel, ON1XK. Ivo is continuosly
updating his mailer program. His newest release supports built-in BinHex
support, selectable sound chimes for incoming mail, "quoting" of forwarded
messages and lots more. If you are not using this program... why not? Check
for the latest release in the directory before "blind" ftp'ing. This
software supports System 7's Ballon Help and is System 7 savy! Available via
anonymous FTP from ucsd.edu (/hamradio/packet/tcpip/incoming).
Author is available via internet: on1xk@igg.tno.nl <<-- new address for Ivo
System 7 savy

<SoftKiss 1.8>
Control panel device that emulates a TNC running in KISS mode. For use with
packet-radio modems such as the Baycom kit and PacketMac Modem. Version 1.8
July 9 1993 update since 1.6. KD6PAG found a bug in quoting recieved escape
and end characters is sofktiss 1.6. The bug and the fix and patch are all
correct, thanks for some great detective work. Lots of doc files and drawings
included in this archive! Requires the Serial Tool from Apple's
Communications Toolbox! Available on the HAMNET forum of Compuserve, America
Online and via anonymous FTP from akutaktak.andrew.cmu.edu (/aw0g).

System 7

<PacketMac Modem>
PacketMac Modem kits can be obtained from: Sigma Design Associates, P.O. Box 49085, Colorado Springs, CO 80919, (719) 260-5513 (after 1/94). Dexter Francis can be reached at FRANCIS4@AppleLink.Apple.COM

<Savant 1.0.1>
A new packet terminal front-end by the author of Virtuoso. Savant has a split window interface, but it's also a multi-window, multi-connection interface and will work with almost any TNC,
unlike MacRatt or HostMaster.
A demo version of the product is available at cpre1.ee.iastate.edu (pub/ke0ph) or via US Mail, send a SAS disk mailer and disk to CM Technologies, Inc., RR#1, Box 83A, Kelley, IA 50134 (515) 597-2051.
System 7, 32-bit, '040 cache clean and it supports the required AppleEvents.

<MacRatt with FAX>
Terminal program for use with AEA's PK-232 multimode controller. Supports packet, CW, RTTY, AMTOR, and facsimile. Includes cable. Advanced Electronic Applications, P.O. Box C-2160, Lynnwood, WA
98036.

<Host Master 1.2>
The Kantronics Host Master software provides an easy to use, multifunctional terminal program for the TNC. Host Master Mac is a simultaneous multi-mode terminal program for the Mac written by Kevin Krueger, N0IOS and marketed by Kantronics. It is a commercial product available from most of the ham radio stores and supports single and multiple packet connects, packet monitoring, and HF operation (with KAM) each on a separate window, all at the same time. This package retails for $69.95 in the US and is intuitive, friendly, and well supported by Kantronics. Current version as of 10/20/93 is 1.2. It is hoped that a future version will support FAX but currently Hostmaster supports PACKET, AMTOR, RTTY, PACTOR (KAM ver. 6.0), CW, and NAVTEX.
Features: text and binary file transfer; packet conferencing; color or B&W windows; cut, copy, paste between windows; call exchange and data/time stamp; auto startup/shutdown commands; transmit buffers for each mode; simultaneous dual port, multiple connects; supports KPC-2, KPC-2400, KPC-4, KAM and Data Engine. Requires: Macintosh Plus w/ System 6.05 or better. Current Kantronics firmware.
System 7 compatible, with baloon help

<PacketTracker 1.05>
PacketTracker ver 1.05 is a program that monitors packet activity and keeps track of what is going on. It draws a graphical map showing who is talking to who and displays statistics of all current stations and keeps a running tally of activity. PacketTracker was written for both the casual packet user and the network manager or BBS operator. The casual packet user will be able to learn a great deal about what is happening in packet around him; which stations are generating the most data and what some of them are. he will be able to see graphically what stations he can hitdirectly and which ones he

cannot. For the network manager and BBS operator, PacketTracker provides extensive insight to the operation of the local network and problems such as excessive retries on a path. It also allows for extensive logging of channel utilization and other pertinate information.
NOTE: This application requires the Apple's Serial Tool from the Communications Toolbox.
System 7

*** RTTY ***
<MacTTY>
Decodes Baudot or ASCII transmissions. Can also be used for packet radio and other digital modes (including landline data communications). Includes split screen, a 15,000-character type-ahead buffer, and canned messages. Summit Concepts, Suite 102-190, 1840 41st Ave., Capitola, CA 95010.

<WeFaxWorks>
Weather facsimile terminal program for use with Kantronics TNCs. Kantronics rfconcepts, 1202 E. 23rd Street, Lawrence, KS 66046.

<MacMultiCom 1.0>
MFJ sells MacMultiCom 1.0 for their 1278 multimode controller. MacMultiCom supports all of the modes of the 1278: packet, rtty, ascii, pactor, amtor, gray scale faxes, and many different formats of color sstv. The program requires a minimum of a MacPlus and a hard disk. Requires a color Macintosh and System 7 for best results.
System 7

*** Logging ***
<Ham Radio Station Logbook>
HyperCard stack that stores and displays radio contact information. Automatically stamps entries with time and date. Contacts can be sorted by frequency, call sign, or date of contact. Includes report formats, a "Q-code" reference list, and on-line help. SanSoft, 892 E. Quail Place, Highlands Ranch, CO 80126. (The same program appears to be available from Heizer Software, 1941 Oak Park Blvd., Suite 30, Pleasant Hill, CA 94523.)

<FDLog!>
Contact logging and duping program. Can transmit any of ten programmable CW messages. Generates real-time statistics on QSO rates. System One Control, 3900 85th Ave N, Suite 200, Brooklyn Park, MN 55443.

<MacContest 3.5>
Allows real-time or post-contest logging of a wide variety of contests. Checks for dupes, figures scores instantly, and offers various printouts. Interfaces to TNCs for CW and RTTY contests, to DX packet clusters, to Kenwood transceivers, and to MacinTalk for easy post-contest entry. Gerald Eberle, HB9CEY, P.O. Box 13, CH-4417 Ziefen, Switzerland.

<LOGic>
(Macintosh version scheduled.) Lets you define the rules determining dupes (such as once per band or once per contest). Displays heading, distance, and other information about the country being worked. Automatically enters

contact time; if interfaced directly to a radio, also enters the frequency, band, and mode. Shows status toward earning amateur-radio awards. User-definable database fields. Exchanges data with other programs. Personal Database Applications, 2634 Meadow Bend Court, Duluth, GA 30136.

<HF Logger 1.2>
A real fine HyperCard logging program! (hey... thats all I got!) N0QGQ

<Simple Log .2b>
This little utility is a handy way to create a logging file that you can later import into any data base for analysis, etc. It also shows you that just about anyone can use Think C and create something on the Mac! Let me know if you'd like the source code. WD1V @ WA1WOK.NH.USA.NA Author is John Seney - WD1V, e-mail address is jseney@aol.com. For a copy of this program, mail a SASE disk mailer and 800K disk to: John D. Seney, WD1V, 144 Pepperidge Dr., Manchester, NH 03103
System 7

<Marathon>
Contesting/logging- Have seen references to (March 92 CQ magazine) and heard good things about MARATHON by N 0 IOS. I believe a demo was available for $8. Last address known is: Kevin Krueger, N0IOS, 1780 Ruth St., St.Paul, MN 551O9

*** Propagation, gray line, DX headings ***
<DX Map v1.1>
Displays a map of the world with the terminator. Gives location, prefixes, zone numbers, distance, and heading for any country you select. Freeware. Requires HyperCard 2.0. Available via anonymous FTP from joker.optics.rochester.edu (in the /ham/dxmap directory). Or send a formatted 800K Macintosh disk with a stamped, self-addressed disk mailer to Len Saaf, NV2Z, 52 Raleigh Street, Rochester, NY 14620 (Internet: saaf@joker.optics.rochester.edu).

<SatTrak>
Primarily a satellite tracking program, but also calculates beam headings, Maidenhead grid locations, MUF plots, and band openings. Shareware. Available via anonymous FTP from sumex-aim.stanford.edu (/info-mac/app). Or send a formatted 800K or 14.MB Macintosh disk with stamped, self-addressed disk mailer to Mike Pflueger, WD8KPZ, 6207 W. Beverly Lane, Glendale, AZ 85306.

<Sun Clock>
Desk accessory. Displays a color map of the world, including the terminator. Indicates current time for any location. MLT Software, Inc., P.O. Box 368, Portland, OR 97207.

<DX Window>
Draws a great-circle world map centered on your QTH, with day/night terminator indicated. Displays over 400 DX locations with prefixes and beam headings. Engineering Systems, Inc., P.O. Box 939, Vienna, VA 22183.

<Skycom 1.1>
Enter solar flux and get propagation predictions to desired areas

of the world. Engineering Systems, Inc., P.O. Box 939, Vienna, VA 22183.

<Skycom 1.5>
Provides sunlight status at both ends of a path; MUF, F0F2, and FOT frequencies; S/N ratio of the link; and other information. Engineering Systems, Inc., P.O. Box 939, Vienna, VA 22183.

<DX Helper v1.57B>
Displays beam heading, distance, gray line, and propagation information. Generates great-circle maps. Identifies prefixes, zones, and oblasts. Includes code practice. MacTrak Software, P.O. Box 1590, Port Orchard, WA 98336.

<Mac MiniMUF v5.1>
A greyline and propagation predictor based on the PC version of MiniMUF by K4CFV. It is available directly from him for the price of a formatted disk and SASE (disk mailer). His address in callbook or: Bob Stamper K4CFV, 12510 Shadowrun Blvd., Riverview, FL 33569

<Mac ShortWave v1.2>
A program called Mac Shortwave that figures MUF and LUF. BXA Research in Plano, Texas

*** Satellite tracking ***
<SatTrack v1.02>
Tracks one satellite across a world map as it moves, displays the instantaneous position of several satellites, or generates tables of all satellites visible from a certain location at a given time. Also calculates beam headings, Maidenhead grid locations, and MUFs. Shareware. Available via anonymous FTP from sumex-aim.stanford.edu (/info-mac/app). Or send a formatted 800K Macintosh disk with stamped, self-addressed disk mailer to Mike Pflueger, WD8KPZ, 6207 W. Beverly Lane, Glendale, AZ 85306.

<MacSat v3.1>
Tracks up to 21 satellites simultaneously, either in simulation or real-time mode. Text screen displays ground-track coordinates, range, mean anomaly, visibility (azimuth and elevation) and Doppler shift frequency information for all satellites being tracked. Graphical screen portrays the satellite ground tracks superimposed on a world map. Polar plot displays graphically the precise location of each visible satellite above the observer's horizon. Developed by the Geodetic Research Laboratory of the University of New Brunswick. Available from Richard B. Langley, R.R. 12, Fredericton, N.B. E3B 6H7, Canada (Internet: lang@unb.ca). A demo version of MacSat may be ftp'ed from directory PUB.CANSPACE on unbmvs1.csd.unb.ca.
System 7

<OrbiTrack> <OrbiTrackFPU v2.1.4>
Calculates look angles to selected satellites, plots current satellite positions on a world map, and displays the visible passage of a satellite against background stars (either within the program itself or via a data file that can be read into the Voyager astronomy program). Please note that one version requires an FPU to operate! BEK Developers, P.O. Box 47114, St.

Petersburg, FL 33743. (Bill Bard, CompuServe: 75366,2557) (Note: This replaces BEK's previous MacSat program, which was not related to the program of the same name from UNB.)

<QuikMac>
Macintosh version of N4HY's QuikTrak program. Requires Microsoft BASIC. AMSAT, P.O. Box 27, Washington, DC 20044.

<Satellite Orbit Prediction Program>
Macintosh conversion of W3IWI program. Requires Microsoft BASIC. Send formatted 800K Macintosh disk with stamped, self-addressed disk mailer to Earl Skelton, N3ES, 6311 29th Place NW, Washington, DC 20015. Or send self-addressed stamped envelope for source listing.

<Satellite Pro>
Uses world maps and tables to indicate rising and setting schedules, current locations, mutual visibility opportunities, and footprints. Includes Mercator, polar, and great-circle displays. Optional antenna control. MacTrak Software, P.O. Box 1590, Port Orchard, WA 98366.

<Macintosh Spacecraft Personal Orbit Computations (MacSPOC)>
Software used aboard the Space Shuttle and in Mission Control to track the Shuttle. Models engine burns, orbit perturbations, and the Shuttle's orientation. Free online data uploads during Shuttle missions.
Commercial v1.5 available from Daniel R. Adamo, 4203 Moonlight Shadow Ct., Houston, TX 77059; telephone 713-480-9631; AppleLink: D3176; America Online: AdamoD. Test drive v1.1 available on AppleLink (path "K-12 Education: Education Resources: Science Resources: MacSPOC: Space Shuttle Orbit Software"). Author is on AOL and can be reached as adamod@aol.com via the internet.

*** Antenna design ***
<MacMiniNEC>
Chris Smolinski, N3JLY, 40 South Lake Way, Reisterstown, MD 21136.

*** Radio control ***
<ICOM Radio Control>
Provides a Macintosh interface for controlling ICOM transceivers that use the CI-V remote-control system. Lets you quickly change frequencies and modes. Also does logging and duping. Requires a CI-V to RS-422 converter (schematic included with program).
KE6FG Software, 9763 Pali Avenue, Tujunga, CA 91042.

<FreqValet>
Provides frequencies and DX program info for shortwave radio listeners. The program databases update automatically at 15, 30, or 60 minute intervals, thus providing a continuous display of broadcasts on-the-air at any given time in a spreadsheet like format. Features include sorting of data, scanning, and on-screen changing of databases. The program will convert Tom Sundstrom's dBase shorwave broadcast listing to FreqValet format and will do the same for Shorwave Navigator users. Separate cards are

provided for DX Programs, Ship to Shore, and Utility broadcasts. Computer control modules are available at extra cost for the Drake R8, Kenwood R-5000, JRC NRD-525, and NRD-535 receivers.
DX Computing, 232 Squaw Creek Road, Willow Park, TX 76087. Telephone (817) 441-9188 or (817) 441-5555 (fax). Author is available via internet: dxcomp@aol.com System 7 with HyperCard 2.1

*** Ham radio BBSs ***
<Digikron Systems BBS>
Various ham-related applications, including logging, propagation, Morse code, and packet. (408) 253-1309.

<MacScience BBS>
Various ham-related applications, including antenna design, propagation, WEFAX, packet, and Morse code. (408) 866-4933.

<N8EMR BBS>
Various ham-related files, including packet, DXing, and contesting software; AMSAT bulletins; and several ham newsletters. (614) 895-2553. Also available via FTP on AMPRnet at 44.70.0.1.

<WB3FFV BBS>
Various ham-related software, including packet, contesting, and Morse code applications. (410) 661-2475, 661-2598, and 661-2648.

<ChowdaNet BBS>
(more info at a later date)

*** Online Services carrying Ham Radio software ***
<America Online>
Supports Macintosh, PC's DOS & Windows versions, PS/1, Apple //s, Casio Zoomer. Ham Radio Club (keyword = ham radio) supports all computer types. Software for amateur radio, scanners, swl'ers and general electronics. For 10 FREE hours of trial time send your snail mail address to tstader@aol.com or call 1-800-827-6364 Ext. 6285. This site NOT ftb'able (yet). Internet e-mail.

<CompuServe>
Supports any communications software on most computers Ham Radio area (go hamnet) supports all types of communications formats.
Call 1-800-848-8199 for information. This site NOT ftb'able. Internet e-mail.

<Delphi>
(more info at a later date) Internet e-mail

<GEnie>
(more info at a later date) Internet e-mail

<Prodigy>
Has ham radio message areas, no downloadable software. Limited internet e-mail.

21. Create a rra.digital.packet group?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-01-03 17:48:00 UTC
From: sfarlow@NeoSoft.com
Message-ID: <CJ2Es1.3vp@sugar.NeoSoft.COM>
Source record: 50611

I would like to see a rra.digital.packet newsgroup to separate out packet news from other digital modes. It was a shame that the rra.packet group disappeared.

sfarlow@sugar.neosoft.com

22. NOSVW304 KISS problem

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-01-03 23:20:16 UTC
From: Mike_Beezley.houstoncssc@xerox.COM
Message-ID: <".3-Jan-94.17:20:16.CST".*.Mike_Beezley.houstoncssc@Xerox.com>
Source record: 50614

I just got ahold of NOSVW304 and spent the weekend trying to get it to work. I get to the point where the KISSON.DIA script is called and then it has its problem. It is supposed to put the TNC into KISS mode and apparently it does not get the ' * ' that satisfies the autobaud routine from the TNC (AEA PK88). It appears to bring up NOS but then echos the first input line sending the first parameter command for putting the TNC into KISS. I played around with the WAIT timing values so that I could get it to send the ' * ' at the right time but it still errors out.

I am using an NEC 386SX pc and the aforementioned PK88. I can put the TNC into KISS manually but the KISSON dialer script seems to have a problem. I went through and made all the changes to the AUTOEXEC.NET file and all of the other support files mentioned in the documentation. Anyone seen this or have any ideas?

Thanks folks.

23. Re: NOS Flavors

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-01-03 23:53:38 UTC
From: brandtk@silver.ucs.indiana.edu
Message-ID: <CJ2vpH.EG@usenet.ucs.indiana.edu>
Source record: 50615

hopken@interaccess.com (Ken Hopkins) writes:
>How about one of you NOS gurus posting a little note about the different
>flavors of NOS. There are a bewildering variety of versions, updates,
>features, etc. It would be nice to make sure I'm using the "right" version.

I'll second that! I'm just getting back into packet after a couple of years
off and can't believe how many NOS versions are living at ucsd.edu!
It would be nice to have someone give a synopsis of the different features
of each and what would make me want to run that version.

I am not sure what an "internal" demodulator is. HamComm normally does the demodulation (converting from tones to a high/low signal) in software. A hardware demodulator can be used in parallel to the simple one-chip interface.

From the HamComm 2.2 manual:

14. External converter

An option "External Converter" is available on the "Keying" menu. It can also be controlled by the ALT-F9/ALT-F10 keys. If this option is enabled, a mark/space signal from an external converter or modem chip is expected at the CTS pin of the COM port. Please note that the normal interface is still required. There will be no reception if it is not connected or doesn't get the audio signal from the receiver. Connect the input of the converter and the input of the HamComm interface in parallel to the receiver output.

Why don't you try HamComm -program. I think it would be the easyest
way to decode the signal. The hardware takes only one 741 -op.amp.
and a couple of other components. Veeeeery easy to build. I work
RTTY with HamComm, and it works very fine. ��I use it also as
audio freq. spectrum analyzer :)

Hope this helps ...

PACTOR - An introduction to the protocol (Level 1).
==========
(as at 5th November 1990)

Objectives.

PACTOR (PT, latin "the Mediator") was developed by radio
amateurs for radio amateurs in the course of experiments in
radio communcation; commercial use is not planned.

PACTOR should overcome the current shortage of a reliable and
quick means of telecommunication on short wave, especially for
the bands below 10 MHz.

The design of PT is most suitable for the following points:

- Error-free data transmission
(in practice: proportion of errors less than 10 ** -5)

- True binary data transmission
(e.g. including the ASCII character set)

- Good use of the current channel capacity
(automatic adjustment of baud rate, complete bit synchronous
transmission, Memory-ARQ, no special request frames)

- Good tolerance of interference while maintaining the integrity
of the link.

- Simple means of operation, optimum half-duplex working with quick
switchover and mutually acknowledged QRT

- Flexible polarity (arbitrary Mark and Space definition)

- Simple hardware construction
(Level 1 also suitable for portable and emergency use with
ordinary amateur radio rigs)

- Required bandwidth maximum 600 Hz

- Complete transparency for third parties
(eg. supervision of official authorities)

- Compatibility when upgrading level definition and the supervisor
subsystem

The following developments should be tested with the introduction
of more efficient hardware:

* More efficient character compression (eg Markov encoding)
* Adaptive error correcting coding
* Modified Memory-ARQ
* Modem circuitry with signal processing for bit-level synchronous
demodulation and automatic frequency drift correction, and
for testing new modulation techniques
* Higher data rates for frequencies above 10 MHz
(automatic switchover capability between 200 and 400 baud)

Protocol basics.

The PACTOR mode is similar to AMTOR, which is very good for
ordinary shortwave working. This uses half duplex ARQ; packets
(blocks) of data carrying the information are acknowledged with
short 'receipt' signals (controls) by the receiving station.
When errors occur the receiver can request the repetition of a
packet with relevant control signals.

* Synchronous operation.

To use the available channel capacity well, synchronised
transmission is necessary. The synchronisation must be
maintained throughout the whole of the period of connection.

* Packet length.

A long series of tests has shown that for operation in heavily
fluctuating conditions, it is not good policy to adjust the data
packet length automatically the the actual conditions. Any
modification of the time period leads, especially in bad
conditions, to overlapping of data blocks and controls;
accordingly this method was rejected as inefficient.

The question of the most suitable packet length is answered by
measuring various shortwave channels with an FSK transmission.

The data obtained was transmitted by a computer simulation on
ARQ networks. The optimum packet length on shortwave had a

duration on average of about one second.

The cycle time (packet length + acknowledgment time) in any case should clearly be shorter than the most frequent fading period. Short noise impulses are also included in the computer simulation; without taking these 'bursts' into account the packet lengths could get considerably bigger.

Alternatively the desire for fewer error packets could be aided by the use of error-correcting redundancy as in digital audio techniques. The benefits of these are widespread but are only noticable where the quality of the channel is known and is almost constant. Shortening of packet lengths complies with the rest of the operating techniques (short break-in times).

* Packet integrity.

Data blocks have CRC checking. The use of error-correcting codes is not planned at the moment, but may be built into future upward compatible versions in combination with more efficient hardware.

* Using corrupted packets.

In order to use information received in corrupted packets, PACTOR uses a Memory-ARQ process (see below), which produces a clear increase in transmission rates in bad conditions.

* Adjusting the baud rate.

The throughput of information in actual contacts is limited on the one hand by the available bandwidth (for the given noise level) and on the other by the digital FSK and by apparent phase distortions due to overmodulation. Good results were obtained on shortwave using 200 baud especially during the daytime. In the evening increased distortion of transmission occurs, requiring the reduction of sending speeds to 100 baud.

PACTOR provides automatic control for selecting the most efficient baud rate usable.

The protocol in detail.

Basic principles:

MASTER = the station which initiates the link.
SLAVE = the called station.
TX = transmitter of packets containing information.
RX = receiver of packets containing information.
BK = break-in, put out by the receiver to switch direction of sending.

The following is based on data organised into bytes, since this conforms with the architecture of micro computers. The least significant bit is sent first.

The polarity of the FSK transmission is set one way at the initiation of the connection. With each new packet or control signal the polarity is reversed.

* Timing.

PACTOR works on a synchronised system with a definite time sequence.

Total cycle time : 1.25 sec.
Packet duration : 0.96 sec.
Slot for control signal transmission : 0.29 sec.
Control signal duration : 0.12 sec.

This leaves an idle time of 170 msec for switchover procedures and settling time, allowing for as in AMTOR a maximum DX distance of about 20,000 km (slight difference compared with CQ-DL 11/90).

* Cycle and modes of operation.

1) Internal (standard mode): crystal controlled with 15 ppm accuracy or better. The SLAVE timing is synchronised to the MASTER timing.

2) External (planned for special applications): both stations derive their timing from a central source (eg 50 Hz mains, TV scan frequency, DCF 77).

* Control signals and packet format.

The control signals (CS) are sent by RX to acknowledge received data. Repetition of the same CS indicates 'REQUEST', ie the request for a block to be repeated.

CS3 is used to start the BK-packet, CS4 requests a change in baud rate (see below). The CS has a standard length of 12 bits and is always sent at 100 baud. The bit patterns are chosen to produce optimum

Hamming distances and efficient symmetrical characteristics.

Code Function Bit pattern (hex)

CS1 Acknowledge 4D5
CS2 Acknowledge AB2
CS3 Break-in 34B
CS4 Speed change D2C

All fields, except special cases, comprise one of the three types Header, Data and Admin (status + CRC).

* Structure of packets.

100 baud:

/Header/Data field 64 bits/Status byte/CRC1/CRC2/

200 baud:

/Header/Data field 160 bits/Status bute/CRC1/CRC2/

Details:

1) Header: bit pattern 55 (hex)

The header byte supplies additional information which is
used for synchronisation, for REQUEST recognition in Memory-ARQ
as well as in monitor mode. In each pattern carrying new
information the bit pattern is inverted.

2) Data field:

The data field can contain any digital information; the
format of the codes is specified in the status byte. At the
present time the choice is between 8 bit ASCII and 7 bit ASCII
(Huffman compressed). The ASCII code RS (1E hex) serves as IDLE
character in both cases.

Huffman coding is especially suited to German and English plain
text. The resulting average character length is about 4 or 5
bits. Each packet represents one unit on information: if a
character does not fit completely into one packet, it is sent in
the next data packet.

There is a code table in the appendix.

3) Status byte format:

bit 0: packet count (LSB)
bit 1: packet count (MSB) Format bit 3 bit 2
bit 2: data format (LSB) --> ----------
bit 3: data format (MSB) --> ASCII 8 bit 0 0
bit 4: not yet defined Huffman code 0 1
bit 5: not yet defined not defined 1 0
bit 6: BK request not defined 1 1
bit 7: QRT bit

Bits 0 and 1 are used as a packet count; succesive packets with
the same value are identified by RX as REQUEST packets. Using a
modulus 4 count facilitates the handling of instances of
unrecognised control signals (in practice very unlikely).

4) CRC bytes.

The CRC is calculated according to the CCITT standard, for the
whole packet starting with the data field (ie without Header or,
for CS3, without BK field).

* Initiating a PACTOR connection.

MASTER sends a synchronising packet in the following format:

/Header/S L A V C A L L /S L A V C A / (Header = 55 hex)
/<-----100 baud------->/<-200 baud-->/

This packet contains the SLAVE callsign (max 8 bytes in ASCII) in a 100 baud and 200 baud bit pattern. Shorter callsigns are padded with 0F (hex). The SLAVE station scans the bit stream in the synchronising packet for its own callsign (both polarities are tried) and after succesful synchronisation answers by sending CS. The actual synchronisation is dealt with by the header byte and the eligible number of bytes in the first callsign. The 200 baud pattern is used as a check on the quality of the channel. If it is received without error, it is answered with CS1, if not then with CS4 which leads to an instant reduction of data rate to 100 baud.

Similarly the MASTER searches between two packets following CS in the receiver's window using both polarities. As soon as the first correct CS is received and synchronised, the first normal data packet is sent with Header = AA (hex) and packet count = 1.

* Level definition in the initialisation of the link.

During the initiation of the connection the maximum possible system level for the conditions is unknown, so each connection starts on the lowest level (1). The first characters transmitted contain information about the highest usable software level number, followed by MASTER callsign, finishing with <CR> (eg 1DF4KV <CR>).

If the SLAVE station discovers a discrepancy (system level lower than its own), it notifies the MASTER immediately by means of BK and supervisory information (see below), otherwise the link continues at the level specified by the MASTER. The BK situation is only acted upon at the termination of the MASTER system information (<CR>).

* Changing direction of transmission.

After a correctly received packet the RX station can request a reversal of direction of transmission with a BK control signal (CS3). The CS3 becomes the head of the first data packet sent by the new TX.

The CS3 covers the first three bytes of the packet at 200 baud, and the first two at 100 baud; so in this instance 4 bits remain unused.

The CRC is computed as in a normal data packet, starting from the beginning of the data field. The packet count is set to 0. The next packet after a BK packet gets a header of 55 (hex).

If the TX receives a CS3, he switches immediately to RX mode and reads in the rest of the packet completely. If he receives the

packet with no errors he answers with CS1, or if not with CS3,
in case an immediate 're-break' is required.

A repetition of the BK packet is requested with CS2. The
answering CS to a BK packet starts a CS-length (0.12 sec) delay
before the end of the current TX block.

By setting bit 6 of the status byte, the TX can also request a
BK himself; this status causes the RX to acknowledge with CS3.

* Speed decrease 200 to 100 baud.

The RX can always send a CS4 after a corrupt packet, this is
always interpreted on the TX side as 'REJECT'; the
unacknowledged packet just sent is rejected and the information
contained in it is re-sent in the 100 baud mode. The packet
count of the rejected 200 baud packet is retained in the first
100 baud packet. If the RX recieves a 100 baud block with the
same packet count as a previous 200 baud packet, this means
doubly received information; as many characters (except IDLE) as
arrived in the last 200 baud packet must be ignored in the copy.

After a 'speed down' CS4, the RX and TX set the header to 55
(hex) to reinstate the correct Memory-ARQ function (see below).

Other occurences:

'REJECT' of a QRT packet: -> transmission of a 100 baud QRT packet.
'REJECT' of a BK packet: -> transmission of a normal 100 baud

packet with Header = 55 (hex) instead of the CS3 header.

CS4 serves as 'REQUEST' CS for the first 100 baud block,
acknowledgment follows by means of a CS1 or CS3, after which a
CS4 signal meaning 'speed up' (see below) can be sent again.

* Speed increase 100 to 200 baud.

The RX can acknowledge with CS4 after each correctly received
100 baud packet (except 'REQUEST' packets), which forces the TX
to switch to 200 baud. The RX switches immediately after CS4 to
200 baud receiving. (should the TX not get the CS4, then this is
not combined with additional loss of information; even though
the RX has already adjusted to the 'false' speed. The next
packet would be a 'Request' packet, therefore irrelevant).

CS4s in succession (without the correct CS interspersed) is
interpreted as 'Request', therefore ignored.

After successfully increasing the speed, at least a second 200
baud packet must be received before the next CS4 ('speed down').

Possible rejection:

after the CS4, if the RX obtains an error free 200 baud packet at latest by the end of a predetermined number of cycles, then he answers with an OK CS (different from the last CS before the CS4) and then switches back to 100 baud. The TX must for his part test the CS following the CS4 for OK, and if found switch back to 100 baud without delay and repeat the 200 baud information (or in the case of a QRT, construct a 100 baud QRT block).

* Supervisor concept.

In order to guarantee compatibility with future versions of software, it must be already possible to transmit system information (SI) in the level 1 protocol. To this end a supervisor character (SB) is defined, which shifts from normal text mode to the supervisor level. The character following the SB contains the supervisor function code (SIC) followed by some parameters. A <space> terminates the SI.

Preliminary SI definition:

SB: ASCII <FS> = 1C (hex)
SIC:
A: level number follows ('1' = level 1)
B: Mycall follows (could for example be introduced into IDLE packets, to enable identification for any third parties monitoring)
a . . <DEL> : to put out control characters 01 to 0f (hex); enables complete data transparency.

The complete SI runs like normal text over the PT system, to avoid complications with switching speed. SIs must be able to be inserted immediately as required into the running text, after the last normal character being processed, to avoid errors when repeating messages.

* Ending a PACTOR connection.

Terminating an ARQ link introduces all sorts of problems because information without real acknowledgment must be sent, or acknowledgment of an acknowledgment would be necessary again and again for proper closedown of contact. PACTOR uses special QRT packets to minimise the danger of an uncontrolled QRT:

100 baud:

/Header/G I S L L A C /Status byte/CRC1/CRC2/

200 baud:

/Header/X/G I S L L A C /Header/XXX/Status byte/CRC1/CRC2/
/<-----100 baud------>/

(maximum of 7 significant bytes allowed in callsign)
(X = arbitrary)

The QRT packet is contructed according to the current speed and mode; in doing so the callsign of the other station must be sent from right to left. The callsign is always sent in a 100 baud bit pattern; the QRT bit in the status byte must be set.

When a QRT packet is received the RX sends another acknowledgment control character and then goes into standby mode. The QRT packet must not be passed on to any decoding logic.

Since it is very likely in noisy conditions that the first acknowledgment CS may not be received correctly from the TX, the RX, who has gone into standby mode, must still answer with the correct CS any further QRT packets in the scan time frame. The RX looks for any in the incoming bit stream after the byte reversed callsign in the QRT packet and synchronises with it if need be. Each QRT packet received leads to an acknowledgment CS being sent, in which the polarity of the CS is set to that of the QRT packet.

The RX must of course remember the previous relationship (before standby) betweed CS polarity and block polarity; otherwise the CS frame may be lost.

* Memory ARQ.

Normal ARQ systems dispose of information contained in corrupt packets. Such a procedure leads to the complete failure of a link very swiftly in even low noise conditions, since receiving an error-free packet becomes extremely unlikely.

Using Memory ARQ, copies of the same packet (not yet received error-free) have the received levels (the good signal plus the noise) aggregated for each corresponding bit individually, whereby the effective signal-noise ratio improves ideally by a factor of n, where n is the number of aggregated packets.

For example for the case where n=2 and with constant signal and noise levels:

(N = noise level, S = signal level, <..> = average)

Total signal = 2*S + N1 + N2;

Power of the aggregated signals:
<(2*S + N1 + N2) ** 2> = 4*S**2 + <N1**2> + <N2**2> + <various terms>;

<various terms> = 0 (insignificant);

<N1**2> = <N2**2> = noise power;

--> S/N ratio doubles where n=2, and so on for any n.

This supports the theory that the bit confidence relies on the effective signal-noise ratio --> special case of the law of conservation of energy. When individual bit length and bit

energy are undefinable, Memory-ARQ uses the combined signal energies.

Memory-ARQ lowers the noise level threshold for a link by 10-15 dB. In reality, fluctuating channels must be avoided as packets with bad noise worsen the levels of all aggregated packets considerably. To help this the average noise over the whole packet can be subtracted from these individual aggregations. To minimise the quantification of noise, the use of an 8-bit A-D converter is recommended for observation of the signal levels received.

In PACTOR the following points are derived from Memory-ARQ:

Aggregated packets where the CRC tallies are treated like normal error-free packets. (As the use of a 16 bit CRC guarantees a higher level of integrity, Memory-ARQ brings no disadvantages of any sort.)

Old 'Request' packets sent by TX because of noise in a OK-CS must not be counted in the aggregation. To aid this there is a 'similarity' test, carried out in PACTOR during the scutiny of the header byte. In consecutive packets (carrying new information) the header is inverted, so the RX can recognise without the CRC (in the event of corruption) whether this is a 'Request' packet. Each correct packet (with the CRC ok) leads to the cancellation of the Memory-ARQ aggregates.

With CS3 packets, obviously the 'similarity' test must be carried out for the CS3 header.

PT-Memory-ARQ is also capable, due" to the constantly changing polarity, of averaging constant noise levels, the carrier, or other unsymmetries on the channel.

Appendix

PT Huffman code

Huffman coding is relatively indifferent to differences between real and theoretical alphabet character frequencies, so that similar good results are obtained in German and English plain text. The compresssion factor attained with ASCII amounts to about 1.7 (resulting in 4.5 bits per character). Substantial improvements could be achieved by considering the statistical relationships between the individual characters (Markov encoding).

To my mind, someone who exploits the most efficient information gathering resources first deserves credit, not criticism. For most of us ham radio is a hobby, and as such is relegated to our precious "spare" time. On discrete topics in which I have a serious, sustained interest, I am willing to invest the time to study the literature and really try to learn something. On the other hand, when I have a quick question that I can't answer using whatever resources are immediately at hand, I feel no shame about advertising my ignorance here on the net by asking questions of those with more experience than I.

If one has a genuine love of gardening, then tilling the soil, spreading the fertilizer, sowing the seeds, weeding the plot, and harvesting the yield is the only real way to enjoy fresh vegetables. As for myself, I buy 'em at the supermarket, and to my palette they taste just as good. ;-)

I've had my eye on one of these rigs, too, and although I don't own one I think I can offer a few answers:

o it's crystal controlled, and operates on one of two switch selectable frequencies;

o it's easier to interface to a TNC than using the mic and phone jacks of a convntional rig;

o the T/R switching is faster, which can be important at higher speeds;

o it offers sufficient bandwidth to accomodate 9600 bps operation without modification.

Or at least that's how I understand it. I'm sure that others will point out any lies I've told here....

Todd, KB6JXT

32. 1270 Hz in a modem standard.

>

The Bell 103 modem standard uses 1070 Hz and 1270 Hz as one of its pairs of frequencies. The 'originating' modem transmits on these frequencies. The 'answering' modem transmits on 2025/2225 Hz. Bell 103 modems are used for asynchronous transmissions up to 300 bps.

2225 Hz is normally the mark frequency for the answering modem, 1270 Hz is normally the mark frequency for the originator. (I say 'normally' because the MIL version of this standard reversed the mark and space frequencies.)

Well the synthesizer is crystal controlled (aren't they all), but the
"switch" selects in 5 kHz steps from 800 channels just like most other
2 meter rigs. (Perhaps you're thinking of the Kantronics data radio.)

> o it's easier to interface to a TNC than using the mic and phone
> jacks of a convntional rig;

Ok, it's got a DIN plug in addtion to mic and phone jacks, but I wouldn't
call this a big deal.

> o the T/R switching is faster, which can be important at higher
> speeds;

T/R switching is 5ms, but that's not all that unusual for modern 2 meter
rigs.

> o it offers sufficient bandwidth to accomodate 9600 bps operation
> without modification.

Barely sufficient, the IF filter is still a bit tight.

>Or at least that's how I understand it. I'm sure that others will point out
>any lies I've told here....

Ok. :-)

Look, this is a good 2 meter radio sold without a microphone at a good
price. It works pretty well on packet, but it's not really that special.

Uhhh, 'fraid not. It's synthesized. However, it is "true" FM, not PM,
which makes it better for high-speed packet.

> o it's easier to interface to a TNC than using the mic and phone
> jacks of a convntional rig;
> o the T/R switching is faster, which can be important at higher
> speeds;

Nope, it's *really* just their standard 2m 25W mobile without a mic. The
mic jack is a standard 8 pin DIN plug with the usual non-standard wiring. T/R
times aren't outstanding, but they're OK.

> o it offers sufficient bandwidth to accomodate 9600 bps operation
> without modification.

There's this nice little section in the manual that explains how to open
up the received audio filters, and also where to find the discriminator
output. Nothing special there, either.

>Or at least that's how I understand it. I'm sure that others will point out
>any lies I've told here....

Quite a few, I'm afraid. All of the features you mention (I think) apply to
the Kantronics Data Engine RF deck, but certainly not to the Alinco DR1200T.
I have one in my shack, it's both my packet radio and my home 2m rig. It's
a nice little radio, but it isn't really optimized for packet, except for
not coming with a mic.

> one I think I can offer a few answers....I'm sure that others will
> point out any lies I've told

As it turns out, alas, the only part I had right was this last sentence, and Jim AD1C (reisert@mlo.dec.com) pointed out the reason to me:

> No, Todd, you're thinking of the Kantronics 2-channel 5W radio.

Jim is correct; I commented on my (possibly *still* inaccurate) understanding of the Kantronics D4-10 packet rig. Jerry KF6VB (jkaidor@SynOptics.COM) corrected my errors about the 1200T in detail via private e-mail, and since I haven't seen his comments posted here yet, I have attached his message below. My apologies for the confusion.

> selectable frequencies;

FALSE: It's fully synthesized, with memories and multiple scan modes, and lithium battery backup.

>
> o it's easier to interface to a TNC than using the mic and phone
> jacks of a convntional rig;

Not especially. You connect the TNC to the normal MIC jack in front of the rig. There is an audio output on one of the pins, though. In order to disable the internal speaker, you have to fabricate a mini plug with an 8-ohm resistor to plug into the external speaker jack.

>
> o the T/R switching is faster, which can be important at higher
> speeds;

Faster than what? True, there is no relay, so I suppose its plenty fast enough.

>
> o it offers sufficient bandwidth to accomodate 9600 bps operation
> without modification.

FALSE! To go 9600 baud, you have to replace the IF filter. Alinco was selling these for $15.00, but last time I talked to them, I was told that they don't have it anymore. After you modify the radio for 9600 baud, it won't work with voice. I was lucky; I got one of the last of the 9600baud filters. I wonder if there's enough 9600baud activity to warrant converting it?

My DR-1200T is sitting around without use, because its receiver gets heavy intermod at my QTH. On the other hand, my antique Azden PC-300 HT works fine. I suspect that the Alinco's front end is wideband: it receives the weather broadcast at 160MHz just fine.

I may retire the DR-1200T to mobile use; my impression is that the only packet-specific thing about it is the printing on the front panel. That and the fact that Alinco will tell you how to mod it for 9600baud.

- Jerry Kaidor, KF6VB

:: MediaScan ::
:: SWEDEN CALLING DXERS ::
:: from Radio Sweden ::
:: Number 2192--Jan. 4, 1994 ::
::::::::::::::::::::::::::::::::::::
```

Satellite, shortwave and other electronic media news from Radio Sweden.

This week's bulletin was written by George Wood.

Packet Radio BID SCDX2192

All times UTC unless otherwise noted.

Sorry about our disappearance over the past few weeks. I've been ill, but all is well now. The bad news is that Radio Sweden has cut back on the time allocated to me to write MediaScan. The radio program will only air on the first and third Tuesdays of the month in the future, which doesn't affect this Electronic Edition. But I will have much less time to compile the material. And the orientation will be even more Nordic than previously.

Please note that the deadline for contributions from Internet or CompuServe will be the Monday evening before broadcast. Fax contributions can be made as late as the Tuesday morning before broadcast.

NORDIC MEDIA NEWS:

SWEDEN--Here are the changes in the Radio Sweden English schedule that go into effect on January 10th, caused by deteriorating propagation conditions:

To Asia at 12:30 hrs UTC, 15120 kHz will be replacing 17865, and 13765 kHz will be replacing 17740.

To South America at midnight 30, 6065 kHz replaces 11650, and 9850 kHz replaces 9695.

And to North America at 02:30 and 03:30 hrs, 6195 kHz replaces 11650, and 9850 kHz replaces 9695.

We also continue to be part of the World Radio Network package on MTV's transponder 22 on Astra, audio 7.74 MHz, daily at 21:00 hrs UTC.

Last time we reported that WRN would also be bringing Radio Sweden and other international broadcasters to North America by satellite. The service has now begun. The satellite is ASC-1 at 128 degrees West, C-band transponder 23.

That's used for SCOLA, which carries TV news programs from many countries, including Sweden's TV4. The audio subcarrier is 6.2 MHz. Radio Sweden can be heard at 01:00 and 21:00 hrs.

THOR AND SIRIUS--One of last year's most interesting Nordic media stories was the bidding war between Sweden and Norway for Britain's unused Marco Polo 2 satellite. The Norwegians won, renamed the satellite Thor, and moved it to 1 degree West. They're offering a package of CNN, Eurosport, Discovery, Children's Channel, MTV, and FilmNet to Nordic subscribers. Unfortunately the Norwegians insisted on using the obscure D-MAC standard, with the equally obscure Eurocrypt S coding system.

Well, the Norwegians have had to give up on at least part of that. On December 16th all the Thor channels switched over to D2-MAC, which may be a dead standard as far as most of Europe is concerned, but it is used by FilmNet and by Scansat for its various TV3 channels and the pay movie channels TV1000 and FilmMax. ("Paa TV")

What may have contributed to the change of heart is the Swedish Space Corporation's successful bid to buy the Marco Polo 1 satellite, a bid the Norwegians tried to fight in the British courts. The plan is to move the satellite, now renamed Sirius, to 5 degrees East, alongside Sweden's current direct broadcast satellite Tele-X, which currently carried TV4, TV5 Nordic, and Norway's NHK, along with Radio Sweden.

So far it's unclear what channels will be offered on Sirius, but transmissions are expected to begin in early March. (TT)

ASTRA--Besides competing with Thor, Sirius must also compete with Europe's most popular TV satellite combination, Astra, which has 50 channels at one position in the sky. FilmNet has announced that a number of the coded Astra channels are to be offered on a subscription basis to Scandinavia, using the Videocrypt 2 coding system. Initially the offering will include the Children's Channel, Discovery, Country Music Television, with FilmNet and the Adult Channel as extra options. ("Paa TV")

FILMMAX--TV1000's companion channel FilmMax, which uses Intelsat 601, is now available for satellite subscribers in Sweden. While the channel has been carried in Swedish cable networks since it started, until now only Norwegians could subscribe to the satellite signals. ("Paa TV")

TV5 NORDIC--The French language TV5 has sued to force the Swedish channel TV5 Nordic to change its name. At the end of November, a Swedish court ruled in favor of the French. TV5 Nordic is appealing to a higher court. (TT)

On the other hand, there's good news for the channel with the decision of Capital Cities, which owns the ABC network in the United States, to buy 21 percent of Nordic's owner, the Scandinavian Broadcasting System, which also owns Norway's TV Norge and Denmark's TV2. (TT)

RADIO--The new private commercial radio frequencies in southern and western Sweden were auctioned off on December 6th, 5 channels in Gothenburg, and 2 each in Malm and 7 smaller towns. These were strictly highest bidder

auctions, with no regard for format or even whether the bidders can afford their bids.

Sweden's most expensive radio licence went to the Kinnevik media empire, which bid nearly 400,000 dollars for a Gothenburg channel. Besides TV3, TV1000, FilmMax, part of TV4, along with cable shopping and video channels, Kinnevik also won several key frequencies in the first auction in northern and central Sweden. Besides Gothenburg, they also submitted winning bids this time in 4 other towns.

France's NRJ (or Energy), which won a Stockholm frequency, picked up new ones in Gothenburg and Malm, while another growing network, Radio Rix, picked up channels in Gothenburg and 2 other towns. (TT)

And according to the first surveys after private radio started in Stockholm, NRJ is the capital's most listened to commercial station. 9.5 percent of the population listen to the station for a least 5 minutes a day. ("Dagens Nyheter")

INTERNATIONAL SATELLITES NEWS:

NEW SATELLITES--In recent weeks there have been a number of new satellites launched. The most exciting was American's DBS-1, launched December 17, which together with a twin satellite to be launched in June, will provide Americans with 150 digitally compressed channels at one spot in the sky. (Reuters)

There will be separate services from USSB and Hughes' DirecTV. Together they will offer 100 subscription channels and 50 more pay-per-view channels, using digital compression techniques.

Both satellites will be located at 101 degrees West, and will deliver news, sports, movies, and other programming to American homes equipped with 45 cm (18 inch) antennas. Receiving systems will cost USD 700 plus installation. The cost of subscribing to 100 channels will be around USD 50 a month.

Among the broadcasters lined up for DirecTV are several channels from Turner Broadcasting: CNN International, CNN, Headline News, TNT, Cartoon Network, Superstation TBS, and Turner Classic Movies. Other broadcasters signed up include the USA Network, the Sci-Fi Channel, the Nashville Network, Country Music Television, Discovery, the Learning Channel, E! Entertainment, the Family Channel, Courtroom Television Network, The Weather Channel, Playboy TV, The Golf Channel and The Travel Channel.

There are pay-per-view agreements with Paramount, Sony, MGM, Disney, and Columbia Tristar. Around 50 PPV films will be carried on the 150 channel system once launched.

USSB has announced that their programming lineup contains 14 premium feeds (HBO 1, 2, and 3, Cinemax 1 and 2, and Showtime 1 and 2, East and West in all cases) and six or seven basic channels (MTV, VH-1, Nickelodeon, Comedy Central, E! Entertainment, All News Channel).

Launched along with DBS-1 was Thailand's first satellite, Thaicom-1, which will be competing to broadcast across southeast Asia.

On December 15th, another American satellite, Telstar 401, went into orbit. The Public Broadcasting System will be using the satellite to transmit more than 40 digitally compressed channels, creating what is being described as an "education neighborhood". Most of these new channels will be used for educational programming to schools. The plans include two way contact, in which participating classes would interact with the programming, sending data from computers over the telephone to the closest PBS station, which would relay signals to the satellite.

One transponder would carry the PBS national schedule A and B programs, along with a high definition television program. While HBO and other programmers will be using the General Instrument's DigiCipher II technology, PBS will be using the non-consumer DigiCipher I technology and those digital signals are not compatable with the other system.

Other users of Telstar 401 will include ABC and Paramount, for relays of such programs as " Star Trek" and Entertainment Tonight".

Other satellites recently launched include Mexico's new Solidaridad-1, and the new European weather satellite Meteosat-6, which will be placed over the Greenwhich meridian, replacing the aging satellite at that position.

EUTELSAT--We have a new satellite channel over Europe, Emirates Dubai TV, on Eutelsat 2-F1, on 11.638 GHz. Most programming is in Arabic, but there is news in English at 15:00 and 18:00 hrs UTC.

The German language music video channel Viva is now broadcasting on Eutelsat 2-F1 on 11.006 GHz. ("Paa TV" and James Robinson)

There's also a report that the American Science Fiction Channel will be appearing on this same satellite in April, possibly on 11.678 GHz. ("What Satellite TV")

ASTRA--Sky Sports 2 is reported to be delayed until September. ("Skyguide" and James Robinson)

The Travel Channel is to launch on transponder 24 (JSTV) on February 1, daily 06:00-19:00 hrs.

The new Spanish stations on Astra are the children's channel Minimas on transponder 36 and Cine Classics on number 40. (James Robinson)

There are also rumors a number of channels may be leaving Astra, such as Eurosport and the financially ailing VOX. This could open up transponders for stations such as Super Channel, which would like to be on Astra. ("Skyguide") There's also a rumor that TV3 and TV1000 could be moving to Sirius, but Per Zetterqvist of the Swedish Space Corporation has told Radio Sweden that he is unaware of any such negotiations.

The new Astra channel RTL-5 on transponder 64 is out of reach of most receivers. But if you really want to view the channel (which contains some American material in English, with Dutch subtitles), if your receiver has an offset control you can tune down 15 MHz.

Astra is said to be planning to launch a seventh satellite, Astra 1G, in 1997. It would provide a back-up to the digital TV services that would be carried on 1E and 1F, due to be launched in 1995 and 1996 respectively. ("What Satellite TV")

RADIO--Belgium's Radio Flanders International is now on Astra, although they're using the FilmNet Movies transponder at 10.921 GHz, which is outside the reach of most receivers. The audio is 7.38 MHz.

Irish Satellite Radio is using MTV's transponder 22, 7.92 MHz.

On 3-Sat's transponder 10, RIAS Berlin Radio is to use 7.74 and 7.92 MHz. Deutschlandfunk (isn't this Deutsche Welle now?) is now using 7.38 and 7.56 MHz, a move from transponder 6. Also moving from transponder 6 are Deutsche Welle's foreign service on transponder 2 (RTL) on two separate subcarriers--7.74 and 7.92 MHz.

On West 3's transponder 39 coming radio stations are WDR2 on 7.38 and 7.56 MHz, and WDR4 on 7.74 and 7.92 MHz.

A number of British radio stations are due to start on Astra in the near future. Coming to the UK Living transponder number 34 are BBC Radio 2 (7.38 MHz) and Radio 3 (7.56), and Capital Gold (7.74) and Capital FM (7.92). (James Robinson)

SHORT AND MEDIUM WAVE:

SLOVAKIA--The Slovak Ministry of Transport and Communications has cancelled Radio Free Europe's right to broadcast on a Slovak medium wave frequency. According to a letter from the ministry, the contract between RFE and the government of the then-Czechoslovakia allowing broadcasts on the frequency until 1996, will be terminated by January 31st. (Reuters)

UK--The BBC says that World Service radio now reaches 130 million people, and the figure could be even higher. The audience figures are based on research in 90 countries. Major growth areas are Africa, the Middle East, and Asia. The BBC says the actual figure could be much higher as it has no exact figures from countries like China, Iran, Iraq, and Vietnam. (Reuters)

USA--The Christian Science Church has sold its shortwave transmitter station in Scott's Corner, Maine to a Seventh Day Adventist organization, Prophecy Countdown, Inc. It will broadcast over the transmitter for up to 30 hours a week, beginning January 17.

The Christian Science Church said in August it would consolidate its American shortwave operations at the station it owns in South Carolina, where an additional transmitter is being built for broadcasts to Africa. The church also broadcasts shortwave programs from the Pacific island of Saipan. (AP)

Sweden Calling DXers is the world's oldest radio program for shortwave listeners. Radio Sweden has presented this round-up of radio news, features, and interviews on Tuesdays since 1948.

Radio Sweden broadcasts in English:

Europe and Africa:

17:15 hrs on 1179 and 6065 kHz
18:30 hrs on 1179, 6065, and 9655 kHz
21:30 hrs on 1179, 6065 and 9655 kHz (Sundays only)
22:30 hrs on 1179 and 6065 kHz, and
23:30 hrs on 1179 kHz

Middle East and East Africa:

18:30 hrs on 15145 kHz

Asia and the Pacific:

12:30 hrs on 15240, 17740 and 17865 kHz
23:30 hrs on 11910 kHz and
01:30 hrs on 9695 and 11695 kHz

North America:

1:30 and 14:30 hrs on 15240 and 17870 kHz
02:30 and 03:30 hrs on 9695 and 11650 kHz

South America:

00:30 hrs on 9695 and 11650 kHz

The broadcasts at 17:15, 18:30, 21:30, and 22:30 hrs are also relayed to Europe by satellite:

Astra 1B (19.2 degrees East) transponder 26 (Sky Movies Gold/TV Asia/Adult Channel) at 11.597 GHz, audio subcarrier at 7.74 MHz,

Tele-X (5 degrees East) (TV4 transponder) at 12.207 GHz, audio subcarrier 7.38 MHz.

Radio Sweden is also relayed via the World Radio Network on MTV's transponder 22 on Astra, audio 7.74 MHz, daily at 21:00 hrs UTC.

Radio Sweden is also part of the WRN package to North America on ASC-1, on SCOLA's transponder 23, audio 6.20 MHz, daily at 01:00 and 21:00 hrs.

Contributions can be sent to DX Editor George Wood by fax to +468-667-6283, from MCI Mail or CompuServe to the CompuServe mailbox 70247,3516, from Internet to 70247.3516@compuserve.com, or to SM0IIN at the packet radio BBS SM0ETV.

Reports can also be sent to:

Radio Sweden
S-105 10 Stockholm
Sweden

Contributions should be NEWS about electronic media--from shortwave to satellites--and not loggings of information already available from sources

such as the "World Radio TV Handbook". Clubs and DX publications may reprint material as long as MediaScan/Sweden Calling DXers and the original contributor are acknowledged, with the exception of items from BBC Monitoring, which are copyright.

We welcome comments and suggestions about the electronic edition, Sweden Calling DXers, and our programs in general.

Thanks to this week's contributors Good Listening!

38. TAPR 2 16 k to Netrom

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-01-05 05:05:58 UTC
From: n4tii@kd4nc.uucp
Message-ID: <1994Jan5.050558.5236@kd4nc.uucp>
Source record: 50634

I have an original TAPR 2 Tnc... it only has 16K of ram in it. I was
reading some documentation that says to run the fancy NetRom style eproms,
I would have to have 32K of memory.

Question: Is it possible to modify an original TAPR-2 TNC to 32K of RAM?

If possible, how?

please post here or mail me1

John

39. digital signal

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-01-05 05:38:04 UTC
From: acsys@crl.com
Message-ID: <2gdjns$q3h@crl.crl.com>
Source record: 50632

I've analized a digital transmission as best I can it. It has three modes :

1) single tone sequence at 1270 hz

On the spectrum analizer energy is at 1270 and ~2500 (2nd harmonic?)

2) machine gun sound with the following sequence :
32 cycles at 1270 hz followed by a blast of undetermined complex
waveform of length .33 to .66 of the 32 cycles, followed by
another 32 cycles at 1270 hz...

|32cyc|blast|32cyc|blast|32cyc|blast...

The blast is of random length of .33 to .66 of the length of the
32 cycles.

I can't identify a frequency besides 1270 on the spectrum
analizer.

3) cyclical sounding tone which is 5 cycles at 1270hz followed by a complex
tone 13 times the length of the 5 cycles ...

|5cyc|complex|5cyc|complex|5cyc|complex|...

The spectrum analizer has energy at ~600 hz ~1270 hz ~1800 hz
and ~2500 hz

A typical stream would look like this over a period of 1 min:
1112222122233333333333333333333333333331122113333333333333333

Anyone have the slightest idea what is going on here?

I want to be able to decode this, so I need at least a place to look,
famalier to anyone?

BTW the spectrum analizer I'm using is a software based one using
my sound card.

Thanx,

mycal

40. Re: ALINCO 1200T DATA RADIO

Newsgroup: rec.radio.amateur.digital.misc

From: jra@lawdept.daytonoh.ncr.com
Message-ID: <jra.43.000A39CF@lawdept.daytonoh.ncr.com>
Source record: 50637

In article <tcjCJ4I39.9Fv@netcom.com> tcj@netcom.com (Todd Jonz) writes about the Alinco 1200T radio, and ends with:

>Jim is correct; I commented on my (possibly *still* inaccurate) understanding
>of the Kantronics D4-10 packet rig. Jerry KF6VB (jkaidor@SynOptics.COM)
>corrected my errors about the 1200T in detail via private e-mail, and since I
>haven't seen his comments posted here yet, I have attached his message below.
>My apologies for the confusion.

FWIW, here's some info on the D4-10 radio:

2 channel xtal control, frequency range 420-450 (normal factory tuning for 430MHz), 10W+ output.

The RX bandwidth is selectable for either 60kHz or (I think) /20kHz. The wide position is for 19.2kB, the narrow for 1200/9600/voice.

Has analog I/O for voice, 1200, 9600 baud operation, TTL level for 19.2kB. Has internal data slicer to drive RXD on the TTL port. TXD on the TTL port generates +/-10kHz FSK. Squelch-based DCD.

RX/TX turnaround time less than 5ms (we've run with a TXDelay of 7ms between two of the radios at 19.2kB, though that's too fast for the real world).

The receiver section is <not> similar to the lousy one in the 2 meter version of the DataRadio (the DVR2-2 or whatever) -- it's got 4 helicals in the front end, and we've had no strong-signal problems at moderately high-RF sites.

We've implemented about 20 of these radios in SW Ohio, with pretty good results. The biggest problem is frequency drift -- Kantronics apparently never thought that a high-speed data radio might be installed at remote, non-temperature-controlled sites, and the oscillators move <a lot> with ambient temperature. We solve the problem by putting a little proportional heater in the radio. Not pretty, but it works.

From: M.Fitzgibbons@shu.ac.uk
Message-ID: <M.Fitzgibbons.15.2D2ADBB7@shu.ac.uk>
Source record: 50635

hi, is anyone else using msys116? I am having a few problems with setting the system up and I would welcome any suggestions.

The main problems are with telnet and ftp, other than this the system seems to be working just fine.

Symptoms: I can start an ftp or telnet session, the initial link to the remote station is made. (I can see the reply from the remote on the monitor F2 screen) at this point the system fails. the session hangs.

The documentation on ftp/telnet is a bit thin... am I missing something "obvious" be gentle with me :-)

From: dstone@bnr.ca
Message-ID: <dstone.16.0@bnr.ca>
Source record: 50636

Hello!

I am trying to use SLIP via NOS. I have set up all the necessary directories and files. However, the NOS Usage Documentation is rather sparse...

My question: Once I bring NOS up, how do I send dialing commands (AT Commands) to the modem to dial my remote SLIP Server? Furthermore, once I dial the server, how to I send text commands to start the server?

I am running PMNOS under OS/2 v2.1....

Thanks in advance!

>Am I missing something here? is there a reason why a TNC and a VHF/UHF
>radio can't share the same 12v power supply?

Not in the KPC3's case, I think it runs on a 9V battery ...

There are times when you set up a ground loop by connecting all the equipment together, on VHF/UHF flea (<25W, if you are running this much, I hope the local community calls you an a**h***) power it is not an issue.

However, on HF Packet, I have had to decouple the mic and power connections to get rid of pickup induced in the microphone line from ground loops (the HF rig I had thought had an isolated microphone input, but if you ground one of the sides of the microphone input, the Icom 751A whirls into a flurry of noise once keyed up ...). An interim measure was using separate supplies ...

The answer for the original poster, no problem connecting them together, and if there is, you will be learning an aspect of RF power decoupling ...

The KPC-3 will run with a fairly wide voltage margin, anywhere from 6V to 15V I think (being conservative). I'm running mine at 12V.

47. Need help with FBB & JNOS

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-01-05 23:45:18 UTC
From: psmith@convex.com
Message-ID: <2gfjee$od8@lovecraft.convex.com>
Source record: 50541

I'm attempting to forward from an FBB system to a JNOS system using the phone port on the FBB system. I can forward messages to the JNOS system via the radio with no problems. When I use the same forwarding file but change it to use the phone port, I end up with an error on the forwarding.

If you are successfully using phone forwarding from FBB to a JNOS system, I'd like to exchange a couple of e-mail messages with you on the problem and see if you might be able to help.

It's not just a problem with FBB and phone forwarding because I forward on the phone to 3 other BBS systems without problem. None of the 3 systems are JNOS systems...

Thanks in advance for any help you might provide

hi john, mitch wa4osr here in mobile, alabama...

i am sure you can put 32k in it... you only have to pop the 2 8k chips
and replace them with one 32k chip... tapr has the 32k chips which
come with instructions ... u have to cut a trace at jmp12 top and center
pins on the circuit side of the pc board and add a jumper at jmp12 bottom and
center pins... then install the 32k ram chip at u25... very
simple...

the 32k chip is a 43256l...

hope this helps...

From: roth@news.brandonu.ca
Message-ID: <1994Jan5.224523.6325@news.brandonu.ca>
Source record: 50546

I have been an avid SWL and recently bought a MFJ 1214 Multimode Computer Interface to explore the digital side of the house but I find that the software that comes with it fairly crude with respect its user interface. Does anyone know any other software packages that will work with this device. Ideally they would operate in OS/2 or DOS and even Windoze if I was forced. As I am a computer engineer I would also be interested in technical details concerning the device so that I could try my hand at writing my own code.

Thanks in advace.

Carl - from Sunny Shilo Manitoba.

>in the presence of noise if the noise can cause false zero crossings.

It works surprisingly well if you use a narrow IF filter and get rid
of the noise from the computer/monitor.

I believe the PK-80 is actually a clone of a standard TAPR TNC-2, if
that helps at all.

Sorry I don't have any info any more (I had a PK-80 years ago).

56. G3RUH / K9NG / new TAPR / ???

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-01-06 15:55:47 UTC
From: swick@crl.dec.com
Message-ID: <2ghca3$id5@caspian.crl.dec.com>
Source record: 50552

A few of us in the Central Mass area are upgrading our local TCP/IP environment to 9600 baud. We already have a mixture of equipment in operation, including TAPR 9600 baud modems (the operational one is for the moment in a PK232 on a D4-10) and Kantronics Data Engine+9600b (also on a D4-10). We're expecting a few TEKK radios to arrive any moment now.

Before acquiring much more stuff, I'd like to solicit the net wisdom on the relative merits of the several "g3ruh compatible" modems--particularly the MFJ 9600--and the new TAPR 9600 baud modem. I understand from reviewing NEDA material that the latter is an improvement over the original K9NG modem.

Thanks in advance for any experiences/war stories/recommendations/disrecommendations you may have!

57. Nos that supports DRSI board

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-01-06 21:24:43 UTC
From: jaydhall@everest.Iccy.COM
Message-ID: <9401062124.2B2008@lincoln.ICCY.COM>
Source record: 50553

Hi!
I am very interested in getting Nos to function with my DRSI board. I have tried JNOS and it does not seem to support the attach drsi command. I would like to find a NOS that does support the attach drsi command or at least lets me use the drsi board. If you know of one could you let me know where it is on the internet so I can get it? Thanks..........

Jay wa6mok

By the way, I am using 73 magazine packet articles as a guide. This is why I used JNOS first.....

58. antennas

Newsgroup: rec.radio.amateur.digital.misc

Hi everyone,
I am planning on purchasing two antennas. One for the house and one for the car (mag mount). I will be using them with a Radio Shack HTX-202 FM 2-meter HT. The home one will be used for packet as well as voice.
Can you suggest some good, relatively inexpensive antennas. Thank you.

I don't want to run the TNC on a 9v battery. The tnc is on 24hrs a day,
and I don't feel like changing the battery every week. I don't transmit
on packet at greater than 5 watts either, but I do have to transmit at 50
watts to reach the one repeater, so I was told that having them both
hooked up to the power supply, and then after transmitting at 50 watts
would cause a surge of power that might damage the TNC. I can't afford
another one at the moment, so I am not going to take the chances...

60. HELP: BGET in FBB 5.15b ?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-01-06 23:00:39 UTC
From: gerca@lysator.liu.se
Message-ID: <CJ8D9B.I0D@lysator.liu.se>
Source record: 50555

Does anyone know how BGET in F6FBB v5.15b works ?
I have tried to enter the command BGET filename, but
nothing happends except that the BBS tells me that it is
ready for transmission. I am using GP v1.61. GP opens a
file and waits for the BBS, but the transfer locks up !
Any suggestions are welcome !
Thank you in advance,
Gert E B Carlsson, SM5LWC

Hello All,
For those of you that don't subscribe to F6FBB-LIST@STAT.COM, the latest
version of FBB has been released.

It is version 5.15B and it DOES REQUIRE Version 5.15...So if your brand new,
you'll need to get 5.15 running first, then perform the upgrade...

If you have FTP Access: Check UCSD.EDU, It should be there by now...

UPD515B.ZIP
515B-DOX.ZIP

Thanks to Dean Madsen, for immediately FTP'ing these files after I released
them from my board...

If you do not have FTP access, You may download the files from my LLBBS
or send an SASE DISKMAILER with (1) 1.44m diskette 3 1/2" pre-formatted...

Arizona Network Intertie Group PBBS
+1-602-956-2566,,,,1,,1
300-14,400 V.32 / V.42Bis

The filenames on my system are: UPD515B.ARJ and 515B-DOX.ARJ
They are compressed with ARJ version 2.41...

ADDR: for SASE DiskMailer

FBB 515B
P.O. BOX 44563
Phoenix, Arizona 85064-4563

Best Wishes to all!

Message-ID: <1994Jan7.112508.5773@bradford.ac.uk>
Source record: 50558

Hi

Sorry to any one who is reading this msg for the second time but our systems have been down for the last few weeks so the last msg expired before I had time to read any replys.

I am using a baycom modem (Siskin Mini-Pak) on com1 for packet but am limited to only software that supports that modem directly. What I am looking for is something that will emulate kiss or a similar protocal so I can set all my packet software to use int 14 and pretend it is a normal TNC.

I hope I have provided all the needed info,

Thanks

can > get it? Thanks.....

Do not use the attach drsi command, it is broken. Use the attach scc
command instead. See below for example: (DRSI type 1 card)

```
attach scc 1 init 300 16 2 0 1 0 2 p4915200 8
attach scc 0 ax25 144 236 d1200 wa6fwi-3
attach scc 1 ax25 440 236 d9600 wa6fwi-3
ifconfig 144 descr "146.745 -600 KHz 1200 baud duplex repeater"
ifconfig 440 descr "439.025 9600 baud simplex"
```

If you type "attach ?" you get a list of supported attachments.
If you type "attach scc" you get the list of required entries.

The Sinclair Spectrum had a RTTY program many years ago..... probably about
1984-ish when that came out. I never used it (mainly because I didn't have
a Spectrum) but I worked quite a few stations who did. The Dragon computer
might also have had a similar program at that time.

The DRSI 9600 TNC is probably OK - we use the same modem chip in homebrew
add-on boards in my area and they talk to a real RUH OK (I run a real RUH
and the stn at the other end of the link has a FX489 chip) and I currently
have a 5% retry rate (on a semi-shared channel) to him. We have bolted these
chips (with added scrambler as per RUH) on to TNC2 clones and plug-in 8530
cards for PCs (not quite DRSI clones) and they work OK on all of them.

See if you have an 'attach scc' command because that can be made to work if
you can figure out the syntax. The scc driver is a generic one which can
usually be tweaked to work with any 8530 plug-in board.

69. FBB 5.15B bug report

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-01-07 20:20:59 UTC
From: Odysseus@vnet.IBM.COM
Message-ID: <19940107.122205.661@almaden.ibm.com>
Source record: 50560

Sent by KE4CRB for K0ZXF (Tom):

If you run multiple BBS's with the same call sign, I recommend you do not upgrade to release 5.15b until the following problem is resolved. It could be a setup problem, but then this setup has been running for many months without a problem on release 5.15.
I have two other BBS's I forward to that use the callsign K0ZXF. Of course they use different SSID's but because they do transmit over the air, they do use my valid callsign.
One is another FBB system, and one is a TNC PMS system. Release 5.15b appears to be unable to forward any traffic at all to a station that has the same call as the local BBS.
An example is my PMS which has a call of K0ZXF-13. The FBB system has a call of K0ZXF-0. In the BBS.SYS file I have an entry called PMS.
In the FORWARD.SYS file I have an entry for the station PMS, and in that file section the connect is for the call K0ZXF-13.
The FBB release 5.15b is able to know it needs to send traffic to the other stations with the identical calls, it does the connect, but then it does not send any traffic, but just sends a reverse forward request F>. This effectively prevents the FBB release 5.15b system from ever sending any traffic to another BBS or PMS that has the same call as the FBB 5.15b system.
As a very quick check, I changed the TNC call on the PMS to my brothers call, and changed the connect callsign in the FORWARD.SYS to that call. I changed nothing else, in BBS.SYS the entry PMS was left as is, and now the release 5.15b will forward all waiting traffic to the PMS.
The problem appears to be FBB now looks at the callsign received in the AX.25 packet, and if it is the same base call as what is in INIT.SRV it will not forward any traffic. All the indicators like the FT command say there is traffic waiting, but when it connects, it never sends any traffic.
This bug is very easy to duplicate if you happen to have a TNC with PMS in it. Just set up a BBS in BBS.SYS for an entry of PMS.
In FORWARD.SYS setup the section for PMS to forward to your PMS station which should be using the same base call as your FBB system. Tell it to send all messages for @WW for example. The FT command will show you have many bulletins for BBS PMS, but your FBB system will issue the connect to the PMS station using the correct call, exchange SID's, and then do a reverse forward. It will not send any of the traffic.
Now change the base call in your FORWARD.SYS and in your TNC to a good friends call, and tell it to send to PMS again. This time it will send the traffic.
This same problem is true if the other station is another FBB system, or for that matter any other BBS software system. Release 5.15b appears

to be unable to send to another station that has the same base call
that it has.
This of course renders the multi-BBS sites useless.
This problem has progressively gotten worse with each release of FBB. In
release 5.14d you could send compressed forward between two FBB systems
with the same call, and forward traffic with the same call. In release
5.15 this no longer worked in compressed mode, but did still work in the
MBL mode. Now it does not work at all in any mode. This is probably not
the most common setup you will find, but dual BBS's are not exactly
rare any longer. I hope this is something that can be corrected quickly.
SYSOPs that have more than one BBS with the same call may want to consider
very carefully if they want to risk upgrading until a solution for
the problem can be found.
There is also no way to prevent the two BBS's from generating the exact
same BID/MID since their base call's are identical, and there message
numbers will eventually be the same.
One other thing I noticed. While trying different things, I attempted
to define a BBS in BBS.SYS of K0ZXF, that of course is the same call
that the BBS has in INIT.SRV. This will cause FBB to give you a message
that says there is an unknown BBS K0ZXF in BBS.SYS. In release 5.14d
this worked just fine. In 5.15 it allowed it, but would not send any
traffic for that call to that BBS. In 5.15b it just simple does not
work at all.
If your wondering why I have two BBS's with the same call, but different
SSID's, it's because one is at my office and functions as a HUB BBS
for the Tampa area, the other is at my home and is a general user BBS.
They do both have to transmit my legal call with different SSID's.

You should use the SCC driver instead of the drsi driver, with Jnos.
The SCC driver can handle many devices that use the same usart. Best
docs are found in the source code!

For what it's worth, Tom and others, I just put the upgrade in last night and it does indeed still forward to my second bbs. 5.15 had no problem with it either. I routinely forward back and forth between the two boards. There IS some problem with messages that are addressed to my callsign, no matter what the ssid, but I would expect that would happen now and then. All other traffic flows as it should. All forwarding between computers is done through the 232 port via internal BPQ nodes.

Yes, we need - AS SOON AS POSSIBLE - the patch for the upgrade so that we can go back to using the hyphen in the bid of the second board instead of the underline. The old patch won't do the job, obviously. If anyone comes up with this, please post it loud and clear!

There was such a program for the Tandy Color Computer (COCO). The
Drangon was almost identical (the keyboard rows & columns were reversed,
and the ROMS placed a few memory blocks differently), so no doubt such a
program did exists for the Dragon as well!

I had the same problem here and solved it by running my comm
program twice under the multi-tasker DESQview with different
COMx parameters for each copy.

> Preferable FTP-able, but I can send you a disk if you have it.

First off, is there any particular operating system you'd like these
to run under? :-)

Let's see, the only thing that comes to mind immediately is the KA9Q
software and its variants. I'm sure there are others, but I don't know
about them (I've never really needed to look, except when I was using
a borrowed TNC and 2m rig to run TCP on one freq. and straight AX.25
with my TNC and 2m rig on another, and I was using a variant of KA9Q).

This doesn't help now (or even anytime in the near future), but I'm
considering adapting KAMterm (a host mode term program for Kantronics
TNCs that I wrote) to support multiple serial ports. Of course, this
isn't going to happen until I'm finished porting KAMterm over to UNIX
(it currently runs only under msdog...and I don't like having to reboot
just to run KAMterm). I'm also not sure how I want to handle some of
the internal data structures for multiple serial ports (e.g., handling
times when one port is in host mode and the other isn't, handling both
ports in host mode, ideally without having too much duplication of data,
etc....), but that's just a question of making a decision and running
with it. :-)

The reason I mention this here (now) is this: I'm interested in some
feedback on how many people would be interested in this. I have two TNCs,
but only one 2m radio and one serial port that the TNCs can (normally) use,
so I wouldn't need this feature---it'd be strictly for other folks. Btw,
KAMterm is shareware, not freeware, so keep that in mind.

Later,

what operating system? windows and OS/2 come with terminal programs that should be able to run in parallel and you switch between them. (although i've never been too crazy about softerm...it never seems "simple" to simple things with it.....and have had to lumber through the DOS network version of it as well).

For years, now, I've been interested in telecommunications via packet radio. The impetus is mainly the thought of being able to modem to (theoretically) anywhere in the world with no Long Distance bill.

However, I've never really known how I might go about actually getting into this. I've tried contacting local HAM clubs but they usually know very little about packet. Do any of you have any suggestions as to what might be done to get involved? Also, how would one go about acquiring Internet access through packet radio?

Thanks for any assistance anyone might have for me. Much obliged.

Apollyon

I agree, sometimes making the antenna is more fun than using it. The ARRL antenna book is a pretty good start.

Personally I am using a "Cactus J Pole" and a Quagii (Hybrid between a yagii and a quad). Main thing I like about both is the ease of matching. I hate fooling with Baluns, etc to match the antenna.

Needed the quagi as I have a large hydro noise problem and am a fair way from stations. Now I find myself working off the side as it's gain is too high.... It sure cured my ablilty to work through the hydro noise though..

No problems. Under DESQview I run two copies of Kermit which
in turn run two PK232MBXs. I have one script that sets up
one copy of Kermit to run COM1 @ IRQ4 and another script that
sets up the other copy of Kermit to run COM2 @ IRQ3. In a
third DESQview window I run ProComm Plus to run COM4 @ IRQ5
to an internal Zoom V32.bis modem. All three run at the same
time.

Date: 1994-01-10 03:09:44 UTC
From: PACKET-RADIO@MELPN1.CV.COM
Message-ID: <199401100210.SAA17233@ucsd.edu>
Source record: 50587

Firstly, sorry about the strange user ID, but thats how I get to controll the delivery of this digest here.

RE: FBB5.15b and bid problems for multiple BBS with same callsign.

All I did was just search thru the executable (same as previous versions), and change the four or so instances of %ld_%s to %ld-%s for one of the stations.

Incoming BID/MID are still display correctly.

No ill effects yet. Your system may/may not operate correctly like this. Modify at your own peril!

The other option is to get the local club to put some db your way so that you can afford an extra licence (if you are associated with a local club). This also makes it much easier to track any problems with BID/MID and dupes.

Reply via the packet network pls. Goodness knows how long this means of access will be available to me!

> For years, now, I've been interested in telecommunications via packet radio. The impetus is mainly the thought of being able to modem to (theoretically) anywhere in the world with no Long Distance bill.

The "theoretically" part above is the key. Theoretically you can contact any point in the world on HF packet, provided the ionospheric conditions cooperate, but speed is 300 baud *half duplex*. That's horrible to anyone used to full duplex telco modem speeds. Theoretically you can use VHF relay methods at 1200 or 9600 baud to reach distant stations, but the practical realities are that every hop cuts throughput in half, and two hops is a reasonable practical limit due to collisions with other distant signals, something called the "hidden terminal" problem. Theoretically you can use very high performance systems at UHF, such as 56 kb, 250 kb, or at microwave 1 Mb, but the practical fact is that such networks aren't wide spread yet, and simplex range is very limited, typically 30 miles or less.

> However, I've never really known how I might go about actually getting into this. I've tried contacting local HAM clubs but they usually know very little about packet. Do any of you have any suggestions as to what might be done to get involved? Also, how would one go about acquiring Internet access through packet radio?

The above was intended to dissolve any excessive expectations for amateur packet. However, packet is interesting, and does allow international Email type communications even though interactive communications aren't really feasible. If your expectations don't exceed Email for distant contacts, and relatively low performance interactive contacts at the shorter distances, then packet may be for you. If you have very high expectations, say 1 Mb cooperative computer networking, then you must expect to be a pioneer. The technologies are available, but the political will to build widespread networks doesn't yet exist.

Internet access does exist in some locations, to some extent. However, there are legal issues involved in non-amateur traffic that complicate the picture. I don't want to talk you out of persuing packet, but I don't want you to have unrealistic expectations either. Amateur packet is in it's infancy as an advanced mode. Most operators are at a very low level of technical sophistication at this time.

I just wrote a program, actually modified SimpTerm to handle two windows. It isn't very well debugged yet, but if you want to try a copy I'll be happy to try to get it to you. I uses a split screen that you can make as large or as small as you want. There is a hot key that will let you toggle back and forth and there is a key that will zoom the screen up to full size and back. There isn't any terminal emulation. I'm working on that. Interested? Only works on com1 and com2 right now, but that is easily modified.

Jim.

You could run Windows and open two windows with any terminal program, as long as you set up each window (terminal pgm) to run off different comm ports.

Hello!

What little I know about amateur radio dates back from when my brother
was heavily into it....that's 20 years....(he was 18, I was 10).

Anyway, my question: What level of amateur license is required to
operate packet radio? Is morse code testing required?

On a related line. What good terminal programs allow for individual windows for each stream in multiuser mode. It would also be nice to have a window to monitor other QSO's without all the extra garbage. For instance you could just use your mouse to select a transmission and then all other transmissions to or from that station would be sent to a window and preceeded only with the sending station's call. It would be nice if it also compared the current packet to the last recieved packet from the station and not display duplicate packets that I recieved but the recipient missed. While there is probably nothing out there that has the monitoring features I would like is there an easier way to manage multi-stream conversations?

Thanks,
Dan

Dave:

Kantronics has Hostmaster Software that will do two ports of a TNC and
display both on the screen. You will have to buy it though, and I don't
know if it will work on something not Kantronics ($70 from AES). I
borrowed an AEA program to try out on my MFJ TNC, and it didn't work with
that TNC.--

Dave:

Forgot to mention that I have a shareware package that will control two com
ports from the TNC, but you have to select one port or the other. It does
not do them simultaneously.

[Article crossposted from comp.dcom.fax]
[Author was David Jonsson]
[Posted on 10 Jan 1994 23:03:46 GMT]

What is skyview fax and how do I get it. I have read that it is a cable between a radioreceiver and a serialport that makes all datatraffic on the radio available to the computer. Additional software can decode the poictures etc. How do I get this device? What gruop can tell me what to do with it and where to buy one. Can this be accomplished with an ordinary modem connected to the radio?

>Anyway, my question: What level of amateur license is required to
>operate packet radio? Is morse code testing required?

Mark -- There are now two entry-level licenses for amateur radio. The traditional one is the Novice class license which does require Morse Code, and which permits operation on certain high frequency bands between 3.675 and 28.5 MHz, as well as certain bands above the HF level (220 MHz is the most popular). There is SOME packet activity around 28.1-28.2 MHz, and on 220 MHz, but not much.

The most popular entry license now is the Technician, which involves a theory test which is somewhat more difficult than the Novice (but still not very difficult) and no Morse Code. This license gives no HF privileges (Morse Code is still required there by international treaty), but gives full privileges on all amateur bands above 30 MHz, including 2 meters (144-148 MHz), where most packet activity takes place.

If you're interested primarily in packet, I'd go the Technician route, since you could probably pass the test by spending a weekend studying the license prep materials you can pick up at any Radio Shack store. But don't stop there. Morse Code isn't difficult if you keep at it for a while, and it opens up a whole new world of amateur communications. You might even decide you like it. (Recent statistics show most people are entering the hobby as Technicians, but more are upgrading from there to the license classes that require Morse Code than were doing so from the Novice level when that was the only way to enter the hobby.)

Good luck. It's a great hobby!

The Hamcom software will work with the Hamblaster. I tried it and it worked great! You simply connect the HB audio out to the Ham Comm interface The Hamblaster can be setup to send the correct tones.

The Hamblaster Update

The Hamblaster will be introduced at this hamfest.

JANUARY 1994

Jan 30, Sunday: Odeum, Villa Park, IL - Wheaton Commun-
ity Radio Amateurs hamfest. Odeum Expo Center. 8 AM -
3 PM. Tickets $6 advance, $8 at the door. VEC test-
ing. All flea market tables reserved. To reserve a
table, call (708)231-2428.

Over the past several months I posted updates about a
DSP "The Hamblaster" that Will Torgrim (N9PEA) and myself
are developing.

We are focusing our efforts on a packet modem that allows
the user to improve H.F. reception by interfacing the Ham-
blaster (a PC compatable DSP sound board) to a transceiver
and a packet or all mode TNC. Modems/filters for RTTY,
Packtor, Amtor are also under developement and are compatable
with the same control panal software.

Here are the latest developements

1) We do Windows! There's a receive/demodulator
control panal that allows me to control the FSK demo-
dulator's filter center frequency using a mouse driven
slidebar. There's also an on screen tuning indicator that
mirrors the tuning slidebar. You tune the filter by moving
the mouse cursor over the filter tune slide bar button and
when you press the left mouse button the slide bar button
moves.

2) An option allows me to lock the tuning indicator to the
"Filter Tune" slide bar. The Hamblaster sends frequency in-
formation, that it hears at the output of the first filter,
to the PC via the PC's I/O epansion port. Even in noisy
conditions it can count the center frequency of an FSK signal.
The tuning indicator does jump around in noisy conditions

3) A new Windows control panel provides an on screen digital
storage oscilloscope. By pressing the "SNAP SHOT" button,
you can capture 4 signals and display the traces in a graphics
window. The traces can be resized or you can move the window
left or right. About 100 ms per trace is aquired.
You can select or attach the 4 traces to any of the signals that

are displayed on a block diagram in the o-scope control panal. The Hamblaster captures the signals and stores them in it's own memory. Then the PC gets the data from the Hamblaster via the PC I/O port and stores it in the PC memory. The software displays the aquisition by getting the data from the PC RAM. The process takes about 2 to 3 seconds (the DOS version takes about 1/2 the time to execute).

4) Using Windows multitasking, you can run the Hamblaster software and your favorate a packet program (like PC Packratt). I was even able to run two instances of the same Hamblaster software. Both control panals displayed the tune bar and responded it real time. I also got two o-scope aquisitions.

1-3-94

5) We now have FFT analysis software built into the o-scope control panel. When you click on the "Freq" button the audio spectrum is displayed. You can move the mouse cursor over the display and where ever it is positioned, the frequency is displayed in the status window. When you click the mouse the modem filters jump to the frequency. This feature provides a simple tuning aid.

Another button allows you to convert all 4 traces (mentioned in paragraph 3) to spectral displays. You can, for example, analyze the frequency at the input signal, the modem prefilter and the mark filter output. Based on the FFT, a second button allows you to modify the filter tune limits by clicking on min-max limits that you select.

I have to admit, After I debugged the FFT software and I getting the control panel working to my satifaction, I got hooked on the operation of the Hamblaster system. I spent hours tuning the 40 and 20 meter bands, displaying the FFT and copying CW/RTTY signals through the Hamblaster filters. The FFT really simplifies the tuning process.

Ongoing developments;

1 Post detection carrier detect.
2 HDL protocol decoding
3 Morse code detection/regeneration
4 Adaptive voice filter.
7 DTMF & PL tone detection.

> Dave/KA1NCN

SP (also known as Eskay Packet) by Sigi Kluger, DL1MEN is one of the best multi-windowed multi TNCed programs out there for packet use. Version 4.0 was the last released with source code. Version 5 introduced a KISS driver for TNC operation without the WA8DED hostfirmware. Version 6.1 was the last released as sharewaare. The newest version 7 is a commercial product.

TNCs supported are the DRSI cards, PK-87/88 and TNC2 clones running the WA8DED hostfirmware EPROM, KISS TNCs (including the KAM) and with the TFPCX packet driver, the BayComm type modems. SP will support 9600 baud packet operation as well. Great user interface. LOTS of features and tricks. And EXCELLENT documentation.

For more information: Sigi Kluger, Richard-Strauss-Str 19, D-8000 Munchen 80

Or send me e-mail, I have all the versions from 3.63 to 6.10. Version 6.10 I believe is available from TAPR as well in Tucson, AZ.

I may be way off here---I'm not sure exactly what you're after. If you're looking for something that helps when multiple people are involved in a single conversation, say on some BBS with a conferencing bridge, etc., then I've got nothing for you. :-(

If, however, you're looking for something that does this for ``normal'' packet use, and you just want each active stream in its own window, as well as another window for monitor output, you might want to get with me about KAMterm. It isn't a Windows program---it's plain text mode, but it does have multiple windows (each active stream has its own window, and each of these takes up lines 0-20, or something like that..., of the screen). KAMterm is currently only available for dos, but I'm slowly but surely working on a UNIX version.

Later,

PKGold (for AEA TNCs) and KAGOLD (for Kantronics) do a fantastic job in this area. They allow for multiple packet connects, keeping each separate from the other, monitoring of traffic on the frequency, and if dual port TNC, the ability to run HF on the other side, all at the same time.

Tucson Amateur Packet Radio has moved its offices. The mailing address is:

Tucson Amateur Packet Radio
8987-309 E. Tanque Verde Rd. #337
Tucson, AZ 85749-9399

The voice telephone number is (817) 383-0000. This number has a voice mail system attached and is available 24 hours a day. A FAX server will be operational within the next few weeks to automatically fax information to you.

The incoming FAX number is (817) 566-2544.

More information on the office move will be published in the Winter, 1994 edition of Packet Status Register.

121. cpu upgrade

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-01-12 02:59:00 UTC
From: mark.wehner@almac.co.uk
Message-ID: <6249.3195.uupcb@almac.co.uk>
Source record: 50456

I just install the 486DLC-33 cpu to replace my 386-33. It is the ti version of the cyrix plug in upgrade. I had a few problems with the system locking up. Played with the bios settings a bit and the problems seems (fingers crossed) to have gone away. Restored my original settings and it still works with no lockups. Have a few questions.

1. The Phoenix bios reports that the chip is still a 386, msd said that it was a 486sx and windows said that it is a intel 486. Will the bios need to be upgrade?

2. Now I know what hot is! man that chip is hot. If my stove ever breaks I will be able to still cook eggs :-)
I noticed that the simm slots are close to the cpu, does any on know if I will be able to fit a fan or heat sink to the cpu? does not seem to be enough room for one of those clip on jobs.

In article <1994Jan10.235347.1@ntuvax.ntu.ac.sg> asirene@ntuvax.ntu.ac.sg writes:
> I need some opinions as to whether a PLL/FSK demodulator or a
>2-narrow-filter-decision comparator system is more suitable and effective for
>decoding RTTY. Which is more effective and what are the advantages? If I needed
>to use the same circuit for CW, which is recommended? Tks in advance.

We just finished a long technical thread on this subject in the homebrew
group. In cases where non-Gaussian noise dominates channel errors, most
of the time at HF, the filter/slicer system works better than the PLL
detector. Note: to be effective the filter/slicer design must be *good*,
and that doesn't describe many of the current commercially available designs.
Look up Irv Hoff's articles on the subject in late 60s, early 70s, issues
of QST.

Very narrow, sub-Nyquist, filters can usually be used at HF where signal
levels are typically well above the Gaussian noise floor. And soft decision
comparators can be used that are biased by an integrated sample of the signals.

The filter method can be used to decode CW by using the output of only one
filter. It's response to CW will be closer to the Nyquist frequency and
will perform better vis Gaussian noise than it will for RTTY rates. Note
that intelligent slicer response will be limited though. PLL methods will
also work, but note that if the PLL bandwidth is highly restricted, desired
for noise immunity, it won't follow the keying as well due to slowed lock
time. Note: RTTY waveforms can tolerate more distortion than CW waveforms
because they are of uniform bit length, spacing, and continous carrier.
Filter "smear" or "ringing" is less an issue for RTTY than for CW for this
reason, assuming a competent decision network in both cases.

123. NOS for C64 ?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-01-12 04:28:56 UTC
From: niallp@rflab.ee.ubc.ca
Message-ID: <2gvua8$s2k@nntp.ucs.ubc.ca>
Source record: 50415

Has anyone seen any version of NOS for the C64? I'd expect it
to be a severely crippled version, but it could still be useful
as a telnet and/or ftp only node. Integrated with a packet
assembler a la Digicom/Baycom/PMP would be nice as well.

Anyone interested in such a beast? If it doesn't already exist,
I'll look into porting it, though it would be nice to avoid
re-inventing the wheel.

I have a Ringo Ranger AR-6, the 6 meter antenna. I have found it to be a very good antenna. I used anti-oxidant when putting the antenna together. If you do not do that, the performance will degrade over time. This is true of any nested aluminum tubing antenna.

The ringo's are simple antennas, and do not have huge gain numbers, but they are cheap and they do work. FEMA uses them for their portable repeaters that get used in the wake of disasters. Who cares if a $35 antenna gets destroyed?

Dave, I have had good luck with XPCOM. It is written by a guy out west, KB7XP, I think. You can hook up two tncs to two different comm ports and it will put the text from each one in a separate window. It wants to see either a PK232 or MFJ1278, but I have used kantronics tncs with it too. If you have two pk232s or aea tnc's it will use them in host mode. It is shareware, try and buy. One of our local guys sent a letter to the author with, I think, a bug report, and got a very nice note back, so the author is very responsive. What I'd like to find is a packet program that uses host mode for the MFJ tnc's. I wish I could tell you where to find a copy of xpcom, but if no one else can tell you, I'm pretty sure I have one around here somewhere, all zipped up and ready to go.

131. Quest: PTT trigger signal

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-01-12 14:20:23 UTC
From: norton@joker.optics.rochester.edu
Message-ID: <NORTON.94Jan12142023@joker.optics.rochester.edu>
Source record: 50426

I have the circuit board for the Baycom modem and am trying to hook it
up to my Yaesu FT530...problem is that, while I seem to be able to
receive packet, I can't transmit - the PTT is not being trigger on my
HT. My question is : Does anyone know how the HT's PTT is triggered
through the MIC input?? I think I heard the mechanism is the leaky
mike method....but I dont know what that is. Can anyone tell me?
In addition the Yaesu manual shows the PTT output of the modem
going to the MIC output of the modem through a resistor (and to the
MIC output through a capacitor) ie

```
RADIO MIKE --------------||----<--- MIC output
| C
|
----\/\/\/---- PTT output
R
```

The manual recommends R=2Kohm and C = 10uF

How are these values chosen?

Thanks for any info!!
PS. Could one email to me as well..I dont always get chances to check
the newsgroups out. Thankx

Good luck. The only version out for the C64 that I've heard mentioned
was in an April Fools post a couple of years back. I think once you got
in the ax.25 driver stuff you wouldn't be left with much memory. I think
you need a new computer if you really want to run NOS.

>
Note that one of those "license classes that require Morse Code" is the
Technician license operating on HF; as a Technician license holder, you can
operate HF if you have passed a Morse test. The test is optional, however,
from the standpoint of being issued a license with "technician" written on
it. You do not need to upgrade from Technician to General, Advanced, or Extra
in order to obtain HF access (as seems to be implied by the above).

Yes. :-)

The radiation pattern is not symmetric, mainly because of the odd
matching arrangement I think. Mechanically they can be a problem,
especiallly the Ranger with it's hairpin matching section. Feedline
radiation is a problem because they don't do proper decoupling,
the feed impedance and pattern change when it's wet, etc, etc, etc.
An AEA Isopole is much better, and any of the gain antennas I listed
above will outperform it.

The Ringo's may be a tricky antenna for some people to adjust properly
or else they have just plain bad luck. I have had very good luck with
a number of Ringos and so have others I know. These include the AR-2
as well as AR-2X Ranger version.
I do clean and NoAlOx or Pentrox all the aluminum sleeves and joints and
I also replace the hardware with stainless steel. I currently have a
Ringo Ranger on top of a 60' tree that's been there over 3 years and
still outperforms the Isopole that I put up on a 70' tree last summer.
This surprised me as I also had cleaned, prepared, and measured the
Isopole before installation.
Send me your Ringos if you don't like them. I buy all I can at hamfests
for $10-$20.

Cross-posted to: rec.radio.amateur.digital.misc,sci.electronics

I've been collecting parts to build a Baycom-style modem based on the schematic in TCM3105.ZIP (plus a few details). I've found the TCM3105 chip at JDR...but NO crystal; it needs a 4.43361 MHz crystal to work (surprised? Not.) Naturally, it isn't one of the values listed.

Does JDR now stock it (my catalog is old); at least, where has everyone else gotten theirs. Without the crystal, this will be another project I was never meant for...and the old farts wonder why no one builds...:(

I prefer to work with the CMOS part, CD4046. It is stable to at least 1mhz. And especially nice, the impedences are high enough that you can put active filtering in the feedback loop, to tailor lock-up times vs freq, etc that you just can't do with bipolar parts. One device I built had a lock time of about 1/10th cycle.

I'm playing around with a bread-board demodulator for those strange data streams that resemble FSK, but seem to involve around 60degree phase shifts (maybe 6 bits/cycle? maybe 16k bits/second on a 1800 hz or so carrier)?

I have made .WAV files of some of the signals I've found - if anyone else wants to try them. I've also played around with spectral analysis using a pc sound card and Turtle Beach's Sound Wave software.

Does anybody remember DataRx?

148. NOS for C64 ?

Don't hold your breath. With only 31K of available program space,
anything is going to have to be done in machine code. NOS in all
it's various flavors is written in C. Someone would have to have
a seriously masochistic streak to hand assemble (for efficiency)
even a portion of the usabliity of tcp/ip into a C-64.

Considering that people seem to think that a C-64 with monitor and
drive is worth $350 (beats me how the arrive at this), you would be
better off to spend $250 and buy a used XT.

>want to get on the air with packet and my Mac. I have heard of the poor
mans
>packet and thought it was OK but I really want a TNC type system.
According

Well, I bought Packet Mac Modem kit from Sigma Designs for $30. Then I
got
Net/Mac (TCP/IP) off the net for free, and for AX25 I bought Savant for
$40.
The Packet Mac Modem works just as well as any other *real* TNC that
I have worked with. As a friend says, "You're going to need to have
the computer on, anyway." There are only a few considerations that
would require the real TNC:
1) Running Packet Tracker (a mac program that doesn't run in KISS mode),
2) Using the fancy "mailbox" features of a TNC
3) Sharing the TNC between a Mac and another type of terminal.
4) HF modes

If you absolutely need any of the above, you're better off getting a TNC.
If you're only going to use VHF packet to connect to a BBS, keyboard-to-
keyboard, or run portable off a PowerBook, the Mac Packet Modem is a
good deal.

Hi Keith - Well, I'm gonna take a stab at an answer but probably will get flamed for a bad answer. My understanding is there is no such thing as a map for all of AMPR land 'cuzz they're not all connected yet. You can get a map for your area just as I can get a map for IL, WI, and IN found on several local BBS's. However, you can't send a message to wa9wcp@wa9wcp.ampr.org because there is no connectivity (yet?) between your area and mine. OK, guys, go ahead with the flames!

I've heard Gary complain about the Ringos for a long time. My experience with an AR-2, AR-10 and ARX-2B has subjectively indicated they work well. I haven't had a chance to objectively analyze them, but they favorably compare with other antennas I've used. I regularly work 70miles+ over rough terrain with my Ringo Ranger II (ARX-2B) at 25 feet, with maybe 2dB of feedline loss at 145Mhz and 35W of power at the transmitter, on packet.

I even have a commercial radio buddy who swears the commercial Cushcraft 'ringos' compare favorably to comparable antennas.

Hello Dave. The much maligned Richard Rathburn KB6NQ (who accounts for both "R's" in R & R Associates!) will sell you a complete baycom kit, including a circuit board and all on-board parts/connectors for a mere $20. I've built a handful of these kits for friends who have wanted to dabble in packet, and they work extremely well. Rich can be reached at (310) 474-1315, or at 3106 Glendon Ave., Los Angeles, CA 90034. So, if you're having trouble finding parts, perhaps this is a feasible option for you.

Rich has received a great deal of flack recently (on another newsgroup) regarding a perceived lack of support from his "company." Nobody acknowledged the fact that he typically sells these kits (often containing hard to obtain parts) for less than the retail cost of the individual components. I've purchased several kits from him over the past few years, and have always been quite satisfied.

Hopefully some of the amprnet listings are more reliable then WA4ONG (44.62.0.1) here in Richmond. He goes down without warning and leaves us isolated (since he's the main link for ax.25 mail and the ONLY site for netmail.). I'll be sure to download the list.

161. How to get WNOS to talk to baycom modem?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-01-14 02:37:43 UTC
From: jtg0707@uxa.cso.uiuc.edu
Message-ID: <2h50hn$itq@vixen.cso.uiuc.edu>
Source record: 50452

Ok, I give up!

Anyone has any luck gettting WNOS to run with baycom modem?
I am running out of ideas. What am I missing?

If you've managed to get it to talk to Baycom modem, I will appreciated if
you can send me a copy of your config. files and directory structures.

Thanks in advance.

jtg0707@uxa.cso.uiuc.edu

From: k9cw@prairienet.org
Message-ID: <2h6b85$auf@vixen.cso.uiuc.edu>
Source record: 50457

Greetings! I run a DX PacketCluster system in east central IL with three digipeaters. Currently, all are using TheNet V2.08B. Does anyone have first hand experience with this new X1J version? I think it would be handy to provide on-the-air access to a deviation meter, and there could be other program fixes. The series of articles in CQ magazine suggested that it is a worthwhile upgrade. Any opinions?

Thanks! 73 de Drew K9CW

I am afraid it is not in my latest JDR catalog. 4.43... MHz sounds like the PAL colour subcarrier frequency, so they would probably be available more easily in Europe.

I'm afraid there's nothing out there. You could always fire up a
bridgeboard and run Baycom off of that.

>That company only sells one with 5 ports. who sells one with more ports?
> Ken N8PTT@Delphi.com
>

Amateur Network Supply has a diode matrix board with 6 ports. The Netrix
has other features:

o Easily changes from TheNet to ROSE by moving jumpers
o TNCs plug tight onto the Netrix -- cables not needed

Amateur Network Supply has several other useful products. One of interest
to those whpo have run out of ports on a diode matrix is their wireline
link. Using the wireline and one TNC per diode matrix one can link
multiple diode matrices together.

Don Rotolo, N2IRZ, is the proprietor of Amateur Network Supply. He can be
reached at 201-666-9776. (Sorry, I can't recall the address right now!)

Hello.

I live on a 43' sailboat and am planning on sailing it around the world. I'd like to outfit the boat with a connection to the internet. From what I've learned it sounds like packet radio is the way to go.

Since I'm new to packet radio, I'd like to hear from you if you think packet radio is the best solution. I'd also like to know what kind of equipment would be needed/best to implement this and any good new or (preferably) used sources.

Thanks in advance,

Aaron Morse

> Ken N8PTT@Delphi.com
>
Once you get to six ports, it can be more efficient to arrange them in a ring. Unless you fancy soldering in 720 diodes........

A ring system is basically a standard diode matrix with some diodes left out. You can also have two TNCs talking in the ring at the same time when there are six or more of them, and provided you are careful which TNCs go where in the ring, you shouldn't get too much delay through the node. As a hint consider a ring

```
A
/ \
F B
| |
E C
\ /
D
```

A and D can be talking to their neighbours at the same time (same for other pairs) - just make sure that the flow control from A controls B,C,E and F and the diodes from the A TXD only go to B and F. If I have added it up right (I didn't draw it out.....) you only need 36 diodes (Each TXD is connected to two and each RTS to 4).

Another tip with modern RS232 chips is to make sure one diode connected to each input line has a 100K resistor in parallel, because some of the CMOS input types might not like being 'floated' when all the driving outputs are inactive. A single 100K resistor encourages the input to the right state and is completely overridden when any of the driving outputs goes active.

Another trick I have seen is to use a 4017 IC and a low-frequency clock oscillator to poll each one in turn. Each CTS is wired to a different 4017 output so all but one are held 'busy'. If the DTR of the polled device goes active, it inhibits the clock generator until it goes inactive.
Wire all the RX lines together and connect each TX via a diode to the same line (a 100K resistor as above might be a good idea). Don't forget to use suitable level-shifters!

As a fund raising project for our local DX PacketCluster (W4DW on
the S.E. PacketCluster Network) we will be offering a complete
kit including the PCB to add the over the air deviation meter
to any node.
Amateur Call : NT4O
Price will be $39.00 (plus shipping if bought by mail).

We also intend to have them for sale at the Dayton Hamfest. You
can order prior to then. Drop me an email message for more details.

ARRL NATIONAL DIGITAL CONFERENCE 1994 ANNOUNCED

MINNEAPOLIS, JANUARY 12 -- The TwinsLAN ARC today announced that it will sponsor the 1994 ARRL National Digital Communications Conference on August 19 through 21 at the Thunderbird Hotel and Conference Center in Bloomington, MN. The theme for this year's conference is "Digital Communications - Amateur Radio of Today...and the Future".

The objective of the conference is to create a forum for radio amateurs and experts in digital communications to meet, publish their work and present new ideas and techniques for discussion. Presenters and attendees will have opportunity to exchange ideas and learn about recent hardware and software advances, theories, experimental results, and practical applications. Areas of interest include generation, coding, modulation and demodulation, transmission, networking, processing, presentation and application of voice, text, image and data information.

The conference site is located near the Minneapolis/St. Paul International Airport, just off Interstate I-494. Free 24-hr shuttle service is available to and from the airport.

AGENDA:
The agenda for the three-day event includes informal activities for attendees and family members on Friday, August 19 through noon Sunday, August 21. Formal conference activities, including presentation of papers and six forums are scheduled for Saturday, August 20, from 8:30 am to 5 pm. A detailed agenda will be available when schedules are finalized.

CALL FOR PAPERS:
Anyone interested in digital communications is invited to submit a formal paper for publication in the conference Proceedings. Presentation at the conference is not required for publication. Papers are due by June 20 and should be submitted to Maty Weinberg, ARRL, 225 Main St., Newington, CT 06111 or via Internet at lweinber@arrl.org. A schedule for presentation of papers will be available in early July.

ACCOMMODATIONS:
On-site accommodations are available at a special rate of $67 (plus tax) for single occupancy or $73 (plus tax) for double occupancy. Make

reservations directly with the Thunderbird Hotel at 800 328-1931 before July 29 for these special rates. Be sure to mention you are attending the National Digital Communications Conference. Off-site accommodations are available in the area starting at $39.95. Contact the NDCC Info Line for a list of facilities. Early reservations are encouraged. A list of area campgrounds for RVs is also available. Northwest Airlines is offering an additional 5% discount on airfare to and from the Twin Cities for conference attendees. Call the NDCC Info Line for details.

A FAMILY WEEKEND:
Family participation in the NDCC is encouraged. The hotel has a large pool for guests. Informal outings are planned to the Minnesota Zoo (admission extra) and the Mall of America, the largest indoor shopping mall in the US. Free scheduled shuttle service is also available from the conference center to the Mall. Minnesota is a great place to visit in August. Consider making this weekend an addition to your family vacation plans. Twin Cities and Minnesota tourist information packets are available on request to the NDCC Info Line.

REGISTRATION:
The conference registration fee is $45 per person, which includes a luncheon buffet, a set of conference papers (including those submitted but not presented) and transportation to the Mall of America on Saturday evening. Registration, by check payable to "TwinsLAN Conference", must be received by August 12. Mail your registration form and check to:

1994 National Digital Communications Conference
c/o Paul Ramey WG0G
16266 Finland Ave.
Rosemount, MN 55068

ADDITIONAL INFORMATION:
Contact Paul Ramey at the NDCC Info Line, 612 432-1149 (evenings and weekends) or Carl Estey via Internet e-mail at estey@skyler.mavd.honeywell.com.

NOTE: Please give widest possible distribution. Text may not be appropriate for un-edited re-transmission by Amateur Radio. Check with your local BBS SYSOP before posting.

> *-----------------------------*-------------------------------------*

Hello,

Well Well. I have only just got 'internet connected' this week
(or whatever the expression is...)

I am G0JVU - the designer of the X1J dev meter hardware!
Dave G8KBB and I are the people who have produced it all.

I am perhaps biased, but yes it is worth while to upgrade. We have a full
manual set to support it. Presently it is all available on Compuserve, but
I can soon get it on here somewhere when I get familiar with gophers and the
like. X1J has loads of features, such as full TCP/IP support etc.

I run several X1J repeaters, some up to 6 ports worth of X1J TNCs.

I have small quantities of Dev PCBs - homemade, undrilled, (as per the CQ artical) if required, but MFJ have started to provide kits with double sided (professionally produced) PCBs.

We are presently developing (in addition to the Dev meter);-
a) Signal strength meter
b) Temperature meter
c) Voltage monitor.

This will then have used all four ports of the ADC, but these are not ready yet!

Buck Rogers (K4ABT) is the best contact I know States-side, or MFJ at present.

Otherwise - yours truley!

Best 73

Neville - G0JVU

179. PC/Monitor generated RFI. Suppression?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-01-15 02:43:47 UTC
From: asirene@ntuvax.ntu.ac.sg
Message-ID: <1994Jan15.104347.1@ntuvax.ntu.ac.sg>
Source record: 50467

Hi there,

Hope this is the right place to post this. I don't know if any of you are experiencing the same problems as I am with
PC/Monitor generated RFI. I was wondering if anyone out there has any hints, suggestions, known methods, for suppressing these RFI
and if there's anything I can do to the PC (short of switching it off) to reduce the radiated RF energy. I've been hearing a lot
of people have this problem and it seems that the PC is notorious in this aspect so I welcome any help. Tks.

180. Satalite modes, motorola guides, and msk..

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-01-15 03:56:23 UTC
From: anderson@spool.mu.edu
Message-ID: <2h7ph7$a53@spool.mu.edu>
Source record: 50469

3 unrelated questions for the net,

#1 How/where can I find a listing of what modes are supported by
which amature satalites? I looked in the ARRL handbook, and wasn't able to
find a comprehensive list.

#2 I've seen the term MSK referred to in data on the WD4DSY modems. A set of
these are in my future, but not for a while. Can someone explane what MSK
is, FSK, PSK and their quad variations I'm fimilar with but MSK is new ta me.

#3 Does anyone know how I might get a complete set of Motorola selection
guides,it doesn't matter if there old. Less than 5 years would be nice but
I'm not too picky.

Oh, and has anyone else out there put together Glenn's 10Ghz data link radios?
I'm in the process and thought I'd ask if anyone else had done some and
what they thought.

181. DEC, UNIX, Packet

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-01-15 06:34:32 UTC
From: klausf@tekgen.bv.tek.com
Message-ID: <4981@tekgen.bv.tek.com>
Source record: 50471

Have VAXstation 2000 running ULTRIX, DEC's version of BSD UNIX. Have Ethernet connection, have TCP/IP, Telnet and all that good stuff :-)

Long time ago, the author of "The coocoo's nest" (...spelling of coocoo? I can spell Kuckuck!) informed me of the existence of a ham with call N6??? who had written a full and workable implementation of AX.25 under UNIX.

Lost all information. Anyone have any idea whether this is true? The object here is to run packet without a TNC, purely contained (h'ware & s'ware) within the box.

Direct EMail responses (very) welcome.

Thanks, and 73 de N7EKJ

Klaus

182. TAPR office move

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-01-15 11:33:00 UTC
From: james.mollica@pics.com
Message-ID: <179.450.uupcb@pics.com>

FM.: Do you have the number for TAPR?

Tucson Amateur Packet Radio has moved its offices. The mailing
address is:

Tucson Amateur Packet Radio
8987-309 E. Tanque Verde Rd. #337
Tucson, AZ 85749-9399

The voice telephone number is (817) 383-0000. This number has a
voice mail system attached and is available 24 hours a day. A FAX
server will be operational within the next few weeks to
automatically fax information to you.

The incoming FAX number is (817) 566-2544.

More information on the office move will be published in the
Winter, 1994 edition of Packet Status Register.

Changes: new mailing lists, .packet rmgroup, and .policy updates

(Note: The following is reprinted with the permission of the author.)

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info,
and rec.radio.swap newsgroups. It is intended to serve as a guide for the new
reader on what to find where. Questions and comments may be directed to the
author, Jay Maynard, K5ZC, by Internet electronic mail at
jmaynard@oac.hsc.uth.tmc.edu. This message was last changed on 18 September
1993 to add the mailing lists for the new rec.radio.amateur newsgroups, to
note the rmgroup of rec.radio.amateur.packet, and to officially retire some
(in)famous threads of discussion on rec.radio.amateur.policy.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list
for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions
were held on the mailing list, and sent to the mailboxes of those who had
signed up for it. When the Usenet software was created, and net news as we
now know it was developed, a newsgroup was created for hams: net.ham-radio.
The mailing list and the newsgroup were gatewayed together, eventually.

As the net grew, and as packet radio came into vogue, packet discussion began
to dominate other topics in the group and on the list. This resulted in the
logical solution: a group was created to hold the packet discussion, and
another corresponding mailing list was created as well: net.ham-radio.packet
and PACKET-RADIO, respectively.

These two groups served for several years, and went through Usenet's Great
Renaming essentially unchanged, moving from net.ham-radio[.packet] to
rec.ham-radio[.packet]. Readership and volume grew with the rest of the
network.

The INFO-HAMS mailing list was originally run from a US Army computer at
White Sands Missile Range, SIMTEL20. There were few problems with this
arrangement, but one was that the system was not supposed to be used for
commercial purposes. Since one of hams' favorite pastimes is swapping
gear, it was natural for hams to post messages about equipment for sale
to INFO-HAMS/rec.ham-radio. This ran afoul of SIMTEL20's no-commercial-use
restriction, and after some argument, a group was created specifically
```

for messages like that: rec.ham-radio.swap. This group wasn't gatewayed to a mailing list, thus avoiding problems.

While all this was happening, other folks wanted to discuss other aspects of the world of radio than the personal communications services. Those folks created the rec.radio.shortwave and rec.radio.noncomm newsgroups, and established the precedent of the rec.radio.* hierarchy, which in turn reflected Usenet's overall trend toward a hierarchical name structure.

The debate between proponents of a no-code ham radio license and its opponents grew fierce and voluminous in late 1989 and 1990. Eventually, both sides grew weary of the debate, and those who had not been involved even more so. A proposal for a newsgroup dedicated to licensing issues failed. A later proposal was made for a group that would cover the many recurring legal issues discussions. During discussion of the latter proposal, it became clear that it would be desirable to fit the ham radio groups under the rec.radio.* hierarchy. A full-blown reorganization was passed by Usenet voters in January 1991, leading to the overall structure we now use.

After the reorganization, more and more regular information postings began to appear, and were spread out across the various groups in rec.radio.*. Taking the successful example of the news.answers group, where informational postings from across the net are sent, the group rec.radio.info was created in December, 1992, with Mark Salyzyn, VE6MGS, initially serving as moderator.

In January, 1993, many users started complaining about the volume in rec.radio.amateur.misc. This led to a discussion about a second reorganization, which sparked the creation of a mailing list by Ian Kluft, KD6EUI. This list, which was eventually joined by many of the most prolific posters to the ham radio groups, came up with a proposal to add 11 groups to the rec.radio.amateur hierarchy in April 1993. The subsequent vote, held in May and early June, approved the creation of five groups: rec.radio.amateur.digital.misc (to replace .packet), .equipment, .homebrew, .antenna, and .space.

The Current Groups

I can hear you asking, "OK, so this is all neat history, but what does it have to do with me now?" The answer is that the history of each group has a direct bearing on what the group is used for, and what's considered appropriate where.

The easy one is rec.radio.amateur.misc. It is what rec.ham-radio was renamed to during the reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize

this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, should be removed by September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is now rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there.

The first reorganization added two groups to the list, one of which is rec.radio.amateur.policy. This group was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The other added group is rec.radio.cb. This is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently Mark Salyzyn, VE6MGS. The email address for submissions to the group is rec-radio-info@ve6mgs.ampr.ab.ca. Inquires and other administrivia should be directed to rec-radio-request@ve6mgs.ampr.ab.ca. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas,

commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

A Few Words on Crossposting
===========================

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

Source record: 50477

I want to run PACTOR, so I need to replace
my Kantronics UTU-XT/P. At the same time, it
would be nice to have one box that can do VHF packet
as well. Can anyone compare the MFJ-1278 and the
Kantronics KAM-Plus for HF use?

From previous net wisdom, I've heard that the Kantronics
has better HF filters/modem. But then, the MFJ apparently has
more bells and whistles (CW keyer, SSTV, etc.).

Any comments on the overall quality of the MFJ? Is it buggy?
Are all the bells and whistles actually useful?
I'd rather not use their ads as my sole source of data...

>of people have this problem and it seems that the PC is notorious in this aspect so I welcome any help. Tks.

Yes, this is a common problem. In many cases, it's the monitor that's the main culprit. Try turning off just the monitor and see if most of your noise goes away. If it doesn't, try removing the monitor video cable from the PC. If that doesn't eliminate most of the noise, then the problem is internal to the PC. The answer in all cases is shielding and suppression, but it helps to know at the start which item is the main culprit.

If the monitor is the culprit, there are conductive sprays you can use on the inside of the plastic cabinet to reduce the hash. GC Electronics makes one that works well. You have to strip the monitor and spray the cabinet. Usually you want to spray inside for appearance sake. When you put it back together, watch out that the HV section has adequate clearance with the now conductive case. If it doesn't, glue some fish paper in the proper spots to prevent arc overs. Unless the monitor is a "hot chassis" design, bond the conductive coating to the chassis, and bring a bond wire out from the chassis to station ground. If the monitor is color, the shadow mask in the tube will form an adequate shield, but if it's mono, then you may need to put fine copper screening over the face of the tube. Spray paint it flat black and it'll double as an anti-reflection screen.

If the cable is radiating, first make sure you're using a shielded cable, then use some snap on ferrite chokes on the cable. These chokes are good things to put on *every* external cable.

If the PC is the culprit, scrape paint so that the case halves can bond properly, and add extra screws so that every seam has a screw at least every two inches of it's length. That's what it takes to get a good Faraday cage. Any openings in the case should be covered with copper screen wire. The floppy drive opening is a problem because you need access. The best way to handle this is to shield the entire drive bay from the inside and accept the hash when the drive is in use. Bring a bond wire from the case to station ground.

Of course it always helps to have the radio's antenna as far from
the PC as possible, and brought back to the radio via a well shielded
coax. The radio chassis should be bonded to the station ground. If
you're using a HT (so sorry) then you may have to locate the radio
and TNC far from the PC via a long RS232 cable. Note that the TNC can
also be a source of noise. In some cases it's better to leave the
TNC next to the computer and remote locate the radio with long audio
and control cabling. The TNC should be treated the same way as the PC.
Sand off the paint and add bonding screws. If it's plastic cased, either
use the conductive spray, or put it in a metal box.

MSK stands for Minimum Shift Keying. It's a special modulating waveform
that's shaped to have minimum extra sidebands. Usually it's generated
from a look up table in a ROM. It avoids passing through the zero energy
point that widens the modulation of some other methods. Instead theres a
3 db amplitude variation that's intended to make the resultant RF vector
rotation follow a circular path at 1/4th the baud rate from one data state
to another. Each bit is encoded as a 90 degree rotation of the vector.

I have a question. I have access to Netnews, Internet and email,
Being an Amateur Radio operator, have somewhat of an interest in
packet radio. I am not active on packet (no TNC) and was wondering why
I should get started. There are obvious advantages to delving into a
new mode of communication, to me, something new is fun. What are the
advantages of packet communications with all of these other goodies
(especially the packet to internet gateways)?

191. Re: PC/Monitor generated RFI. Suppression?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-01-17 02:32:40 UTC
From: karn@unix.ka9q.ampr.org
Message-ID: <2hctc8$bvr@qualcomm.com>
Source record: 50527

The original author didn't say what kind of monitor he had, the frequency where he experienced RFI, or any experiments he tried to localize the source. This matters a lot. Many of the early monochrome monitors were very bad. Newer, high quality color VGA monitors have considerably more shielding built in and are much better.

First localize the problem with a few experiments. Try turning down the contrast until the screen goes dark. Does this affect the noise? Now turn the contrast back up and turn down the brightness instead. Try unplugging the video cable from the PC. Plug it back in and turn off the monitor power. Which of these makes a difference?

In the case of a Korean clone of the original IBM PC monochrome monitor that I have, I tracked most of the RFI down to one wire that carried +70 volts to the video output stage. Replacing this wire with a piece of RG-174 coax with some bypass caps almost completely eliminated the noise on HF. A piece of RG-8 braid slipped over the TTL signal cable took care of the rest.

I did coat the inside of the case with conductive paint, but that turned out to be unnecessary. Moral: localize the problem and try simple things first. Resort to the tedious shotgun fixes later only if the simple localized tricks don't work.

>Any comments on the overall quality of the MFJ? Is it buggy?

Doug --

I haven't used my 1278 for Pactor (since MFJ hasn't seen fit to fill my order for the needed upgrade), but have been generally satisfied with it otherwise. The biggest problem with MFJ is that they have a well-deserved reputation for filling orders when they feel like it,, and they frequently don't feel like it for months. But their reputation for shoddy quality is, in my view, really not jusitified.

I have primarily used my 1278 for VHF packet, and HF RTTY, but have also done a little HF keyboard-to-keyboard packet, and have monitored some FAX and SSTV. For those purposes, it's fine. I have also used it a little on HF CW on people who are hopelessly fast for me (13 wpm was a struggle, and 30 out of the question), but as a CW demodulator, it's not too good. I've heard that the KAM is far better on CW, but I doubt that anything is very good on anything other than machine-sent CW. (Of course, any of the multi-modes are fine on sending CW when used either as memory keyers or from the keyboard.)

My impression is that if you're seriously into SSTV, you'll want a dedicated unit, but the 1278 is good for giving you a taste of that mode. I have worked through some decent pileups on RTTY with a non-directional antenna, and have been able to copy some pretty weak stations with audible QRM, so the filters aren't too bad. (If the QRM is too loud and close, copy is impossible, but that's a function of capture effect with my overly wide IF filter in the receiver -- typically, when this happens, NOTHING shows up as getting through the filter in the 1278.)

Although I'm generally satisfied with my 1278, if I had it to do again, I'd probably get a KAM. The reason -- it has the modes that I really use, and is the ONLY multi-mode that I know of which permits simultaneous HF and VHF operation. I'd love to be able to get DX spots on PacketCluster, work them on HF RTTY, and then see what else was on PacketCluster, without logging off and on to the PacketCluster. This didn't seem important at first, since I had never seen the virtues of PacketCluster, but it is a major pain now.

>advantages of packet communications with all of these other goodies

Ken --

I have not used the packet to Internet gateways, but would say that there are at least two big reasons to get active on packet:

1) A lot of amateurs are active on packet who aren't into landline connectivity at all. Thus, there are a lot of posts on the BBSs (especially of equipment), that aren't otherwise available;

2) If you're into DXing, PacketCluster is a major plus for working rare DX. Without it, if you're on 20 meters, for example, you might never know that the rare country you need is currently calling CQ with no takers on 30 or 15 meters.

I'm sure there are lots of other advantages to packet radio over the landline services, but those are the major ones to me.

I have found that the PAKET 5.0 software handles this really well for multiple connects. Each stream is sent to a different window, so logical sense can be made of the incoming text! As far as I know, PAKET 5.0 is not TNC specific and can handle TAPR compatible, AEA, etc.

>
The first thing you need to do is determine whether the noise is generated in the video card or in the monitor. To do this, write a small program that will fill the screen with capital H's. The configuration of this letter is very noisy and the FCC uses it for their testing. Now tune your receiver to one of the offending frequencies. Now try isolating the noise by disconnecting the monitor, turning the monitor off, monitor on-computer off, etc. Also try inserting a wire into the RGB and sync lines of the video card. This will help to eliminate the monitor as a problem.

Chances are that the noise is generated by the video card and radiated by the monitor and that fixes will need to be made to both. A monitor with ferrite beads on both ends of a well shielded cable and a shielded power cord should do alot to reduce the emissions. Generally 100 pF caps from the RGB, horizontal, and vertical sync lines to ground should do alot to reduce the emissions from the video card.

In the event that this does not work you will need to investigate for cabinet radiation from the monitor and computer. Make a loop from some RG58 coax by stripping back the shield a few inches and making a couple of turns about an 1-2 inches in diameter. Solder the center lead to where you stripped back the shield. Plug this loop into your receiver and use it to probe the computer setup. A faulty computer cabinet can be easily closed up with fingerstock, braid, or other conductive materials. Shielding a monitor cabinet is a lot more difficult and could cause safety problems (high voltage) or overheating.

When all else fails remember to purchase a computer from a reputable manufacturer such as IBM, COMPAQ, Zenith Data Systems, etc. These companies usually take the time to ensure that the computers they sell meet with EMI requirements. Unlike some manufacturers that sell cheap clones and do not spend the money to make sure that they will be EMI quiet.

Good luck, hope you fix it.

As> there has any hints, suggestions, known methods, for suppressing RFI
As> and if there's anything I can do to the PC (short of switching it
As> off) to reduce the radiated RF energy. I've been hearing a lot
As> of people have this problem and it seems that the PC is
As> notorious in this aspect so I welcome any help. Tks.

I had a problem with this myself. Much of the problem came from the
cable to the video board. Note that the cable was "built-in", i.e.
I could not replace the cable with a better shielded one. I eventually
found a set of chokes that came with another monitor. These did the
job. (The chokes were 2 sets of split ferrite "tubes", designed to
surround the cable and suppress RF noise. They are held together
by using small tie wraps.) This was not some off-brand monitor,
but a nationally known top quality brand. The chokes came with a
cheap Korean monitor.

If the PC is properly enclosed (cover on and screwed down, all the
empty board slots covered), the most common problem is cheap cables.
Get cables with as much shielding as you can find (metal braid AND
foil, with metal covers for the connectors). INMAC sells the best
cables I've ever found. These may cure your problem. If the PC
is covered, the cables are quiet, then you may need to get some
copper foil and apply it to potential gaps in the metal case.

If you are trying to run packet with an HT, get an external antenna
and try it.

Source record: 50493

Bob, W6SWE suggested that I query your group with this question.

We have been using MFJ-127x series TNC2s with all sorts of various
firmware with outstanding results.

However ... the other day I purchased an MFJ-1274C (new C-series which
allows for off-the-shelf 19200 baud opns at the serial port).

The MFJ manual for the C-model says that ROSE, NETRON, TheNet are (still)
compatible with the unit.

HOWEVER ... I am not able to get WA8DED or NORD<>LINK firmware (which works
in all my earlier model TNC2s) to work in the C-model.

A call to MFJ confirmed that these specific firmware packages had not been
tested by them for the C-model.

Anyone have any information on the C-series and how I might get it running
with WA8DED and/or NORD<>LINK formware?

A comparision between my diamond x510hna and arx2b (on about 145 MHz) is that the ringo is impacted by water, snow and ice loading. This follows, because the matching network is at the bottom of the ringo, and it's completely exposed. The 510 network is completely contained within fiberglas.

73, Gord.

Re: Packet radio diode matrix
> Info request from Ken N8PTT@Delphi.com
We developed a 8 channel switch that was described in QEX of June 1991
(I think) we still have the critical parts. Our switch uses the full
8 channels with no complains for years.

209. Re: BBS software sites

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-01-18 19:02:15 UTC
From: hanko@wv.mentorg.com
Message-ID: <2hhbnn$3va@wvhpadm1.mentorg.com>
Source record: 50500

I upload new versions to ucsd.edu, sometimes it takes Brian
a while to move the upload over to the apropriate directory.

Version 16.10 should be there now, and 16.11 will be there
"real soon now" - perhaps a couple weeks.

210. Higher Speeds with the G3RUH 9600 baud Packet Radio Modem

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-01-18 19:42:37 UTC
From: lu7akc@asarin.ORG.AR
Message-ID: <gate.qTJDgc1w165w@asarin.org.ar>

$RUH93235

Higher Speeds with the G3RUH 9600 baud Packet Radio Modem
---
by James Miller G3RUH

1993 Aug 23

The modem is capable of speeds up to 64000 baud. This limit is set by the maximum rate that the DAC chips can operate. This note describes how to achieve rates from 4800 to 64000 baud. The slowest speed is suitable for 12.5 kHz channelised radios. The highest speed suits radios that have broadcast FM bandwidth filters.

To implement a higher speed you need to:

1. Increase your TXData rate (!)
2. Increase the associated TXClock
3. Change some analogue filter components proportional to the speed increase.

It is not necessary to change either of the eproms. If you are going for a higher speed, it is likely that the radios involved are "specials" and you will already have wide bandwidth and flattish group delay, so the loopback selection 0 from the standard ROM will be OK.

The table below suggests the best conditions for different speeds. Component references are for my own PCB card. Clones are different.

Data Rate - Baud
Comp 4800 9600 19200 38400 64000

R6 220k 100k 47k 22k 15k

211. Help: Need schematic for Baycom 7910 HF/VHF modem

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-01-18 21:17:46 UTC
From: Nguyent@snowmass.ksc.nasa.gov
Message-ID: <1994Jan18.161746.1187@titan.ksc.nasa.gov>
Source record: 50502

Hi!

I am looking for a schematic of the Baycom Modem using the 7910
chip. The modem is supposed to be capable of VHF and HF.
I would appreciate any help and will be glad to refund your cost.
I may be reached by Email or posting.

213. Small Radio-Net

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-01-19 03:20:21 UTC
From: an50585@anon.penet.fi
Message-ID: <203751Z20011994@anon.penet.fi>
Source record: 50521

(Sorry for sending this through the anonymous server - my local news server is freaked)

Hello, I am setting up a small radio network... I do not have an amateur radio liscense, and I do not have much experience with packet/other digital radio.

anyway, here's what the setup will be:
-3 to 4 nodes, hopefully 19.2, but will go as low as 2400. One node, if possible, will be portable (i.e. run on batteries w/laptop)
-Lowest cost as possible - hopefully less than $400 per node
-Fixed freq, but not in amateur band. If there's any unallocated spectrum, that would work best, but who knows.
-Range of about 5 miles, there is a lot (a *> LOT <*) of trees here, but I am up on a hill side, above the rest of the city.

If anyone has any ideas, or even a price quote, please email me...
Thanks

Hi,
Does anyone know how to receive the 100 Hz sub-carrier
BCD information transmitted by WWV and WWVH? I tried the sidebands
to not avail. Do I need some special hardware?
Tks in advance.

I'm looking for any site carrying the following satellite programs:

P3?.? Not completely sure of the filename, but it begins with P3.

Also, PB and PG something.

This is a relay for a ham friend who does not have Internet access.

And now for something completely different, how do I go about getting
an AMSAT account?

Thanks much!

73,
Scott

225. TNC-2 modem @ 9600?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-01-20 04:56:20 UTC
From: n7oo@huachuca-emh8.ARmy.MIL
Message-ID: <199401200504.VAA10684@ucsd.edu>
Source record: 50516

Has anyone on the net modified the internal modem in the TAPR TNC-2 to
actually work at 9600 baud? Thinking this would be a quick and dirty
way to get 9600 baud full-duplex on an experimental 10 GHz link here,
was rather non-plused to discover the TNC won't talk to itself at
9600 baud on the radio port.

Dealing with Computer generated RFI/EMI

1.0 Introduction

One of the most frustrating problems about using computers with radios, whether it be for controlling purposes or for decoding, is the amount of RFI generated by these machines. Most of the time, the RFI generated is enough to render certain bands useless and on other bands, it may drown out any weak signals and distort or interfere with signals that you want. This is totally unacceptable for working with digital modes and even for CW. Thus one of the most frequently asked question is how this RFI may be reduced or eliminated. The bad news is that, there is no way that I know to completely remove the computer generated RFI in most situations. The good news is that there are definite steps that we can take to reduce the RFI to a very acceptable level and in some cases, it will almost disappear altogether. This document is a compilation of suggestions from various persons and some of the things I have tried with my own system when dealing with this problem. Many of the documents I have seen relate to situations involving transmitters and how not to generate them. This document is written from a receiving point of view.

I suppose most people would have already tried the basic steps to improve signal conditions by having the receiver and antenna as far removed, physically and electrically from the RFI source (computers and monitors in our case) but I am also aware that sometimes there are limitations and constraints as to how much distance can be had. One may have also tried changing the orientation of the computer, monitor, receiver and antennas and feeds to see if things get better. Having done all that, what else can be done? This is the predicament I had and thus this document.

The standard disclaimer applies and I will not be responsible for any accidents although I have tried my best to present the following information in the best integrity.

2.0 RFI Sources

Before we actually begin tackling the problem, it might be helpful to know something about why computer generates RFI and how these get into the receiver. The two main components of the computer is the main CPU and the monitor (for simplicity sake). The computer runs at a certain clock rate as determined by an internal oscillator. Most of the time the rates are something like 4.77 mHz, 8 mHz, 12 mHz, 16 mHz, 20 mHz, 25 mHz, 33 mHz, 40

mHz, 50 mHz, 66 mHz and 80 mHz. This is not the only clock involved, there is also another oscillator on the video generator card and sometimes a few oscillators, plus those on other cards. As you can see, these clocks are all oscillating in the HF and L-VHF regions which may interfere with signals we would like to receive. To make things worse, these clocks are usually sub-divided into a number of other frequencies within the computer. Since the computer is a digital system, the characteristic waveform of these signals are square-wave and square-waves tends to result in a lot of harmonics. The video card also generates RFI because the data-pixel-rate is often high enough to fall into the HF regions. All these reasons are why computers and monitors are tops when it comes to generating RFI. This is often made worse by computers with cheap plastic casings which do not shield the system.

The first thing we want to do is to determine how much RFI is being generated by the CPU and the monitor. It may be that the CPU is not radiating at all but the monitor is the culprit, or vice versa. This can be done by switching off the monitor and leaving the CPU on just to see how much RFI is getting into the radio. The following is a suggested procedure:-

1) Do a quick sweep across the bands to find out where the RFI is the strongest. This is helpful because if we can reduce the RFI here, there should normally be a corresponding decrease of RFI everywhere else but not necessarily so.

2) Disconnect the mouse, serial cables and printer cables, keyboard, video cable, video power. If you can, run the receiver on batteries for this part. Now turn on the computer and see if the RFI is increased by any appreciable amount.

3) Now, connect the keyboard (with the CPU on), then the mouse, then the serial cable, the parallel cable, the video cable, monitor power cable (don't turn on yet). As you reconnect these, note the increase of RFI if any. You should now have some idea as to which is the main contributor of RFI. If you should have the good fortune that none of these result in any appreciable increase of RFI then you're in luck.

4) Turn on the monitor and note the increase in RFI. Run both text and graphics modes to see if the RFI is affected.

5) Reconnect the radio to the power supply and again note the RFI increase if any.

6) Disconnect the radio from any antenna, both external and internal, and note if the RFI goes away. Note that on some radios, when you unplug the external antenna connection, the internal antenna is automatically activated. To prevent this, plug in a dummy plug to the anstenna socket.

By now you should have a pretty good idea of which components are contributing to RFI. Keep these notes, while we move on to another point, RFI paths.

Earl Morse KZ8E suggest this for pin-pointing RFI source:-

In the event that this does not work you will need to investigate for cabinet radiation from the monitor and computer. Make a loop from some RG58 coax by stripping back the shield a few inches and making a couple of turns about an 1-2 inches in diameter. Solder the center lead to where you stripped back the shield. Plug this loop into your receiver and use it to probe the computer setup. A faulty computer cabinet can be easily closed up with fingerstock, braid, or other conductive materials. Shielding a monitor cabinet is a lot more difficult and could cause safety problems (high voltage) or overheating.

3.0 RFI paths

RFI gets into the receiver from the source through a number of paths. This can be through the power supply, through the "earth" point of the power supply, through direct radio emission, even through "shielding" which are not properly designed or used. There are a number of ways to deal with these situations. If in (6) above, your radio is still picking up RFI with no antenna connected then, the shielding in your receiver is poor. If in (5) above, the RFI increases as you reconnect the radio to the mains power supply or adaptor, then RFI is coming in through the power supply. If your radio is connected directly or indirectly to the computer through the serial port or some other interface, that too could be a path for RFI. You will know if this is a problem as you go through step (3) above. If the RFI increases appreciably as you reconnect the external antenna, then the RFI may be coming from direct emission or is being picked up from the antenna feed.

Remember that in many cases, RFI is coming in from more than one path so it is important to check out all possibilities. On the other hand if one path is the overwhelming problem, you may want to deal only with that. Other basic things are to keep cables as short as necessary.

4.0 Killing RFI

As you can probably see, RFI is a combination of problems and not one problem. It can be classified into 3 categories:-

a) Shielding problems
b) Filtering problems
c) Design problems

These are not definitive categories but are used for simplicity. In many cases, poor shielding is a prime suspect. So we will deal with this first. Now to get on with the real action.

4.1 Shielding problems

When we talk about shielding, there are 4 things to consider, the radio itself, the monitor, the CPU and the antenna/feed combination. Poor shielding can be an inherent problem to some designs but can also be due to dirty connectors and old parts. Go through the equipment to make sure that

all the connection points are secure, this is especially in connection to the antenna shielding, radio power supply, CPU casing, cabling. Make sure that the wires are not old and all the connections are clean, no oxides on surfaces.

If the problem is a design one, such as poor shielding in a radio as determined by step (6) in section 2.0 on RFI sources, or poor monitor or CPU shielding, then we need to provide an adequate shield. This can normally be done using tin/aluminium foils or conductive spray. The basic idea is that we must line the casing of the equipment to be shielded with a barrier to RFI. This must be done carefully because since the shielding is conductive, it is possible to accidentally short circuit something and fry your radio or whatever it is you are trying to shield. The spray is probably the easiest to use but also quite expensive. My feeling is that metal foil probably provides better shielding but is harder to apply. The conductive spray or paint has a lower conductivity but spreads more evenly and gets into difficult to reach locations more readily. What you need to do is to carefully remove the plastic casing of the radio or monitor, paying attention to cabling and eletrical contacts. Remember that opening the case will almost certainly invalidate the warranty on the equipment. Clean the insides of the case thoroughly and make sure that it is dry and free of dust or grease before applying the spray. You may need to apply several coatings to get better shielding. Make sure that at some point in the casing, the applied shielding comes into contact with ground. Remember that in monitors, chassis is not always connected to ground so check this out first. For the shielding to be effective, you need to provide as complete a "wrap" as possible but remember not to spray onto switches or anything that might cause a short circuit. Also prevent blocking up ventilation holes. You may at this point wonder about the screen itself. Well in most color monitors, the mask inside the monitor acts as a shield of sorts. Wait for the coat of paint or spray to dry before replacing the cover. Try to ensure good grounding for the shield and avoid scratching off the paint. If arcing should occur, use some insulating tape over the area. The kind of spray that I use is known as EMI-LAC or EMV-LACK (by Cramolin) and is of German origin. There are many other makes and most should work okay. In the event that you cannot find either paint, spray or suitable foil, conductive tape will do also.

Shielding of cables are also important. Try to make sure that the video cable has a good shielding/screening. The same applies to serial and parallel cables and, of course, the antenna feed should be well shielded. For antenna feeds, avoid TV 75 ohm coaxes as these normally do not provide sufficient screening. Try RG-58-C/U (which I think has better screening that RG-58-A/U) or some other high-screening type cables like RG-8 and the like. Well screened antenna feeds go a long way to remove RFI. I have been told that the equipment should all be connected to a firm ground via heavy gauge wire or braid. This is probably true and if you can, why not. Where cables terminate, use good and appropriate connectors such as PL-259 or something similar. In all cases, provide the screening with a good ground. A well screened antenna feed may eliminate up to 80% of the RFI in some case, or more. If you are listening on VHF and UHF however, the length of the feed

may need to be weighed against signal losses in the feed itself. Feeds such as the 9913 have lower losses but are quite expensive. Use them if you can however. Personally I still find the RG-58 to be the easiest to work with.

Sometimes, in some CPU units, there may be some parts which are difficult to shield, such as the disk-drive. This is not too serious since the drive is not operative most of the time, but if you elect to try to screen that also, remember that the screen must all be well connected eletrically. The same goes for the rest of the computer casing. If you can, use one with a proper metal casing on all sides. What we want is a Faraday Cage so see that the whole case is well grounded. Scrape off some paint at the screws so that there can be good electrical contact everywhere.

Other exposed connectors and splitters (which are not recommendable) can also be letting in RFI so you may want to check out their screening as well.

4.2 Filtering problems

This represents the next major path for RFI. In some poor designs, RFI is not properly filtered out of the computer or monitor power supply and it thus leaks out into the mains, and from there into the radio power supply and finally into the RF section (or AF sometimes) of the receiver. This type of problems can normally be improved by using a line filter for the equipment's power supply. Make sure that the line filter is rated for the power the cable is meant to carry or it may burn up. Other than using line filters, you can also use ferrite beads and toroids on most any lines. Experiment around with a bunch of these things. You could also put a bunch of ferrite beads on the antenna feed line and this will act as a kind of balun as well as preventing RFI from travelling on the screening. There are many types of ferrite RF chokes, clip on types and ready made types, which can be used. The ARRL Handbook has a description of some of these devices. Line filters and RFCs can do wonders so experiment with them at various strategic places such as power supplies, some audio lines etc.

Other than that, RFI often comes through other data lines and control lines in parallel and serial ports as well as video ports. Besides using ferrite beads on these, you may want to connect small value capacitors between the lines to ground. For parallel and serial lines, use 0.01 uF capacitors (multilayer, MKT if possible, others may work well too), and for video ports, connect 100 pF capacitors from the RGB, H-Sync and V-Sync to ground. These may have some other effects on the lines so experiment with slightly higher or lower capacitor values.

If you are receiving on certain bands only, a bandpass, highpass or lowpass filter may help if used on the receiver front-end.

4.3 Design problems

RFI problems are sometimes compounded by poor antenna or receiver design. Antenna impedance mismatch, for example, can make things worse that it needs to be. As such, use of baluns and transmatches may help. Although the coax antenna feed is supposed to keep out RFI, a mismatched antenna and

feed may result in the coax screening itself picking up RFI. So if you are using coax feed into a balanced dipole, try using a balun at the feed point. Balun designs are really simple to build and can be found in the ARRL handbook also. The impedance matching of the antenna to the feed can also be handled by the balun. Baluns, being what they are, normally incur some signal loss but in a good balun, this is insignificant compared to losses in the feed itself. Besides, loss of signal strength is often made up for by improved S/N ratio. I have not confirmed this but some out of band RFI can be reduced by the use of antenna tuners which provide better selectivity. Such tuners can easily be made from any number of designs found in amateur circles because commercial ones tend to be rather expensive and come with S.W.R. meters and other fancy things that the RX-only SWL does not need. In my case, a coax feeding into an off-center-fed-dipole, the balun did wonders to the S/N ratio and I actually say a signal strength improvement. This does not mean that the balun improves gain but the selectivity it provides may prevent the receiver AGC from kicking in and drowning out the weaker station thus resulting in a higher apparent signal strength.

Excessive gain, such as may be the case with antenna pre-amplifiers will not always improve the S/N because then the noise gets amplified along with the signal. In this respect, normally a masthead pre-amp will perform better.

Decoupling in some digital equipment is not properly done and can lead to RFI being insufficiently suppressed. This can be remedied by placing 0.1 uF capacitors along all points in the power supply of the equipment between supply and ground. This may sound silly to some because it may seem easier to use one big capacitor, but while the electrical property at DC may be similar, the distributed capacitance has a different effect on RF. You want to ensure that your power supplies are properly decoupled and no unwanted oscillations are taking place in the regulators.

The directivity properties of the antenna can also help improve signal conditions under RFI. The loop antenna, for example, can be positioned so that it nulls out at the RFI source. I haven't tried this myself but in theory it should work but I cannot comment on the actualy performance you can get out of this. Similarly the dipole also exhibits certain directive properties which can be taken advantage of to reduce RFI.

5.0 Other measures

Besides the above, if one is using the computer for receiving CW/RTTY or other digital signals, a good IF or AF filter will help in removing unwanted noise. The advantages of the different filter types are detailed in the ARRL Handbook. For those who are more well off, a DSP adaptive filter can be of added convenience, aside from all the other SC (Switched Capacitor) filters, Notch filters. Again, I do not have the privilege to speak from experience. Bandpass filters are quite easy to construct and you may want to experiment with certain designs before investing in the real thing.

For those who are thinking of a new computer, I hear that notebooks
have very low RFI emission and may be very suitable for radio use.

In case you are like me and don't live near the ground floor, you
may want to use a balanced antenna system which does not require a ground or
you may want to get one of MFJ's Artificial Ground. Here is an excerpt from
Scott N3FI to me about this:-

I picked up this thing called the MFJ Artificial Ground, which consists of
(I think parallel) an LC circuit and a counterpoise wire. This allows you to
"tune" the reactance out of the counterpoise wire so that it "seems" like
an earth ground to the shack. No more zaps on your microphone!
Don't know if necessary on RCV only, though. Wouldn't imagine so. Just
remember that electrical outlet ground is ground at 60 Hz, but NOT in the
MHz. Your whole wiring system will act as an antenna!

6.0 Conclusion and Credits

RFI has been a most perplexing problem and will continue to be so as
long as manufacturers of computers do not think if it as a problem. I
welcome contributions and other suggestions so that we can advance in our
fight against RFI. Please direct all suggestions to:-

asirene@ntuvax.ntu.ac.sg

I would also like to thank persons who have offered their advice and
experience in RFI problems. Tks.

Gary Coffman KE4ZV gary@ke4zv.atl.ga.us
Tom Bruhns K71TM tomb@lsid.hp.com
Andrew Moore dmoore@viper.cis.upenn.edu
others whom I may have lost their names ...

The ARRL Handbook offers many helpful information concerning baluns,
transmatches, filters and chokes. These will come in helpful for those who
want to find out more about antenna and transmission line theory.
Information can also be gotten from the ARRL e-mail server. Simple send a
mail containing nothing but HELP to info@arrl.org to get started. The server
contains some more information on RFI and related problems.

Have fun, down with RFI.

227. Data about Repeaters

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-01-20 16:29:47 UTC
From: ab154@FreeNet.Carleton.CA
Message-ID: <CJxsHo.DD3@freenet.carleton.ca>
Source record: 50519

Hello to all Hams:

My name is Bryan Parlee, VE3BKP, a native of Ontario and a temporary resident of Nova Scotia, Canada. I am attending the College of Geographic Sciences and as an Amateur Operator (although only 8months with my ticket) I am looking for some data. My career and study area deals with spatial mapping, satellite imagery, computer modelling and so on. This industry area is known as Geomatics. I am intending to construct/design a Communications Database/Mapping system using existing GIS software like SPANS or ARC/INFO. What is missing however, are known sources of informations/data for Ontario repeaters. I have a list of the actual repaters, call, input, and output...but I would like to go deeper than that with data such as wattage, RX range, Transmission radius, location coordinates, packet linkage info, and functions available.

Does anyone know of such a source or perhaps a contact that could provide such information??

My e-mail address is gis308@cogs.ns.ca

....73's and Thanx , Bryan (VE3BKP)

Source record: 50522

I'm looking for software (and hardware??) to recieve weatherfaxes
on my boat. (I have an ICOM 600 maritime SSB transciever). In
some nautical magazines and catologs they sell some software that
will recieve these faxes and RTTY,AMTOR,PACTOR using just a small
interface on the serial port. Complete for $99. This sounds great,
the only problem is it runs on a PC. Is there anything like this
for the Mac? (The same catalog sells something that both sends and
recieves for the mac for $449. Ouch!) I've been looking around the
net and I seems like JVFAX is something similar to the PC commercial
software, but again for the PC. I'm not against doing a little soldering
or even porting code, so any help would be greatly appreciated.

Thanks,
Darren Garnier

: was rather non-plused to discover the TNC won't talk to itself at
: 9600 baud on the radio port.
: 73 de Jack

mfj and pac-com make reasonably priced ~$100 range 9600 baud modems
that will mount inside the tnc-2... these are based on the g3ruh design...
actually, the g3ruh design will i think run 56k baud... if u r going
to use it on 10 gig, look in this newsgroup for maybe it was in
the rsgb news last week or 2 for an article by g3ruh on component
changes for different -faster- baud rates for his design...

the rs-232 driver in the tnc-2 is a lm-324 op amp... this op amp won't
hack it at 9600 baud... 2400 or maybe 4800 is max... replace the
lm-324 wil a tl084 or tl074 fet input opamp and it will run at
9600 easily... i have moded mine for 19200, works fine... the
tl074 and tl084 are direct plug in replacements for the lm324...

Message-ID: <1994Jan21.015305.9861@bogomips.ee.ubc.ca>
Source record: 50526

How do you register an MX record if you've been allocated an ampr net
IP address? (I know about some automatic registering based at ucsd.edu
I think; but I don't know how to use it).

What kind of coordination (whom do we talk to?) is needed for TCP/IP
routing of a subnet on the 44.x.y.z ampr net onto the real internet?
I guess there are several layers of authorization, starting with our
local internet connection, but I want to know how far up we have to go
to get this working. I ask this because whenever I have used
"traceroute" on a 44 ip address (or call.ampr.org), it always shows
routing going down to UCSD, and from there it goes to the destination.
This is pretty ugly, as there are usually more direct routes.

It's been a while since I've done this, but I think the PK-88/232
w/mailbox has to be polled by the BBS. The PK-88 won't initiate a contact
by itself, but will forward outbound mail when polled for it by a BBS.

By the time you read this, BPQ 4.07a (not what the subject said!) should
be available on ftp.demon.co.uk:/pub/ham

If it isn't there, try a bit later (depends on when the sys admin moves it
from the upload directory).

246. Notebook interference to HT?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-01-24 00:42:06 UTC
From: HEAGYWS@ctrvax.Vanderbilt.Edu
Message-ID: <1994Jan24.004206.6505@news.vanderbilt.edu>
Source record: 50539

I am successfully running a packet station using a Gateway 386/25 and
a KPC-3 and a Realistic HTX-202. I have recently tried the same
configuration except using a Compudyne 396SXL notebook computer.
When using this computer, I get so much interference on the HT that
I can not even squelch it out. I have tried several different
antennas but it was no help. What can you recommend I do to make
this a usable packet setup?

Thanks...Win (KE4IHG)

247. RE: WWV BCD Subcarrier. Help.

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-01-24 02:21:49 UTC
From: ka7oei@uugate.wa7slg.ampr.ORG
Message-ID: <47533@uugate.wa7slg.ampr.org>
Source record: 50342

The 100 Hz subcarrier is JUST a 100 Hz modulation.

Tune it in on an AM receiver and run it through a 100 Hz bandpass filter.

The data transmitted via the BCD code is fairly straightfoward.
It is transmitted at 1 pulse per second and the binary-to-decimal
weighting scheme is 1-2-4-8.

The binary 0 consists of 20 cycles of the 100 Hz tone (200 milliseconds)
and a binary 1 consists of 50 cycles (500 milliseconds) of the tone.
The tones are synched to begin at the BEGINNING of the second. Since the
second "click" has precedence over the 100 Hz tone, the first 30 millisecond
portion of each 100 Hz tone is muted (so it is 170 and 470 ms long, really...)

The time is expressed as hour (0-23) with 2 groups, and 3 groups to express
the day of the year. They are sent, in groups, as 1-10-100, so
for day 321, it would send a BCD 1, 2, then a 3.

There are "position" identifying pulses that last 800 milliseconds (770,
with the muting of the first part) and the first one (P1) occurs at
10 seconds (seconds) P1 at 20 seconds (hours), P3 occurs at 30 seconds
(days).

There are also UT1 time corrections, but I don't want to run this too long...

254. Ka9q for windows

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-01-24 17:07:28 UTC
From: ereimber@dcc.uchile.cl
Message-ID: <1994Jan24.170728.38478@dcc.uchile.cl>
Source record: 50347

Hi!.

Recently, I asked if there is a version of ka9q for windows. here
are some answers:

THERE IS NO KA9Q.
The versions of Ka9q will not run under a DOS box in Windows, but
there are some patches that will help you.
There is also a software called Trumped Winsock that implements
TCP/IP in windows.

Thanks to everyone who answered me.

Erich Reimberg N.

ereimber@dcc.uchile.cl (Erich Reimberg N.) writes:

> THERE IS NO KA9Q [for windows].
> The versions of Ka9q will not run under a DOS box in Windows, but
> there are some patches that will help you.

Now I'm confused. I have been running PA0GRI's version of KA9Q's NOS in a DOS window under Windows(tm) for a month now. It works like a charm. I leave it running while my daughter uses Write, Paintbrush, games, etc...

Sometimes I even run PCelm in a second DOS window and use a Windows based freeware emacs rip-off to edit mail and replies.

I am only running a 16MHz 386SX with 8Meg and a VGA monitor.

I haven't tried Phil's latest one from Mecca under Windows, but, I imagine it would work the same. While the L&G (Latest and Greatest) from KA9Q himself doesn't have some of the features of JNOS, MFNOS, GRINOS, etc, etc, etc, it does have an on screen unACK'd frame counter and a separate session for trace stuff.

>Thanks to everyone who answered me.
You're quite welcome. For the benefit of others, here is what I sent Erich last week:

| I don't know if there is one FOR windows. I doubt it. On ucsd.edu is a
| file /hamradio/packet/tcpip/mswin/mswinnos.zip. It contains some notes and
| a .PIF file that will allow NOS to run in a DOS window under Windows(tm).
| It works quite well.
|
| This will NOT work with the BayCom style modems. They put too much load on
| the system to be able to run under Windows.

TOP-TEN SLOGANS FOR DIGITAL MODE - by WA2EAA
--------------------------------

17. "FECing" is OK, but I prefer "Masterstation".
16. Take TNC (you're old if you "get" this).
15. Just the FAX, ma'am.
14. COMPRESSED PACKET runs 8-level code. You can KISS ASCII.
13. I FEC'd for hours, but my contact never came.
12. You bet your ASCII I run digital mode!
11. "QRL?" the frequency first: Practice safe FECs.
10. AMTOR is just a baby-SITOR. (bah-dump!)
9. Reach out & FEC someone.
8. DIGITAL MODE: It's a kick in the ASCII!
7. AMTOR: It's FEC'n fun!
6. Noah's ARQ.
5. In AMTOR it takes two to perform "Masterstation".
4. FEC until you're ARQ'd.
3. I can't decode 7-level, so you'd better byte my ASCII.
2. Keep on FEC'n (tie-dyed shirt seen at a 'Dead concert).

and the number 1 slogan

1. Put your TNC in loopback, and FEC yourself!

Sorry for any added confusion. My use of 'Mecca' here was as in "a place that is regarded as the center of an activity or interest". Sort of the sanctum of ham radio ftp, which in this case I believe to be ucsd.edu. It was not intended to be a site name.

Thanks to tk@sequent.com (Tom Kloos) for pointing out the possible confusion. [Who knew there would be a sight named mecca.epri.com?]

JNOS version 1.07b or later WILL run in a Window happily.
You can find it on UCSD.EDU and many other FTP sites.

Do an archie search on "JNOS" for more options.

To All Hams World-Wide,

I spotted a reference to a FREE logging program on a conference that I monitor on USENET. I had the article published in our Club newsletter as well as mailed to over 75 Hamclubs throughout Calif., Hawaii, the East Coast!

A friend of mine sent for this program. He received his program but it isn't free. I find this sort of advertising to be deceptive and misleading. I find that $49.99 is not exactly free or did I miss something when I read the following description to SPLog.

The following text was excerpted from the post on USENET and the docs that came with SPLog!

---

* * * FREE LOGBOOK SOFTWARE * * *
^^^^^^^^^^^^^^^^^^^^^

Greetings to all.

Latest version of very popular Logging software SPLog is now available to the world at large.

For your free copy, send a formatted disk of your choice
^^^^^^^^^

(IBM format) with SASE (Foreign stamps are No Good in Canada) to:

Peter Pfeiffer
63 Beaver Cr.
Brantford, Ont.
N3P 1T3
Canada

Please do not send thin envelopes. Try to send a disc mailer and I will re-use it to return your disc.
This is a free offer so try not to put me to any expense.
^^^^^^^^^^

The following is an excerpt from SPLog's documentaion files
^^

8.0 SPLog License

SPLog is NOT a Public Domain program and is NOT free. SPLog is copyright (C) 1990-1994 by Alpha Business Software.

Regular Registration Price $49.99
^^^^^

Version Introducion (Until May 1, 94) $39.99

^^^^^
Registered Users: Upgrade Diskette $15.00
^^^^^
Non-registered users of this program are granted a limited one
month license to SPLog to evaluate the programs suitability for their
requirements. Any usage of SPLog beyond evaluation time period
requires registration of each copy of the program used. Use of non-
registered copies of SPLog beyond the original evaluation period is
prohibited.

I plan to send a copy of this post to Peter, VE3NPL@VE3EUK.#SCON.ON.CAN.NA,
via packet as well as all the shareware, hamradio conferences available to
me through the Internet as well as copies to editors of various hamradio
publications!

No indeed. I've been known to pass on the occasional bit of mail to 'BPQ (mail me and ask nicely), but otherwise it's G8BPQ@GB7BAD.#23.GBR.EU.

272. Q: Monicor, Inc. -- Software ???

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-01-25 20:24:46 UTC
From: jaeger@sunrayce.solar.umn.edu
Message-ID: <CK7CpB.J5u@news.cis.umn.edu>
Source record: 50364

I was wondering if anyone has had experience designing software for
a radio frequency modem from Monicor in Florida. I've been assigned
the daunting task of developing software to route up to 16 separate
links from handheld radios on a plant floor and a mainframe.

I anticipate using a 386 or 486 running DOS as the router and I would
like to see/hear what others have done in this arena. Specifically

-- What data structure, functions, and exceptions NEED to be available?
-- What is the best way to control the UART in the PC?
-- What time division routines can be used knowing my hardware constraints?
-- Is there any C or C++ shareware out there I can use?

please respond via email

I use JNOS (latest version) and it works fine in a dos window (so far).
I use it to connect via slip to my work systems. I`m still for something
else (PC-TCP ?) better though.

275. Need chipset for wireless high speed communications

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-01-25 22:06:47 UTC
From: mar6019@tamsun.tamu.edu
Message-ID: <2i455n$fll@tamsun.tamu.edu>
Source record: 50369

I'm looking for a chipset to transmit data over a short distance. We've found a wideband FSK receiver from Motorola that supports 2Mbaud (MC13055), but we they don't seem to have a transmitter for it. Their tech support claims the MC2833 will work, but it appears to be AFSK.
We're wanting to transmit 200kbps at least, and higher if possible (1 Mbps is our goal). Any ideas?

Thanks in advance,

Marc

I'm trying to install net package (ka9q internet protocol package) under
Linux, with my pk232 us model, and I have always problems : missing files,
manuals to short...etc...

I never arrived to send a ping frame to another station !

Is there someone who use net (or something better ?) under Linux with a
pk232 who can send me his config files (like startup.net) ?

Thanks in advance...
(sorry but english is not my native langage)

On what band? FM with that bandwidth is really
only practical in the microwave bands (10 or 24 GHz), where modulation is
commonly done with a varactor or directly to the gunn diode. Have you
thought about spread spectrum? You could probably use the 906-928MHz band,
and achieve reasonable process gain with the spreading codes U.S. hams
are allowed. The ckts for the modulator and demodulator can be just
microstrip transmission lines for phasing, and then balanced double
balanced modulators. Of course, there is some digital stuff required to
generate the spreading codes, sync the things up, and separate the data,
but I notice you use the term 'chip set' so I think you probably are used
to digital stuff <Grin!>.

PS. what is your call sign? (You are licenced, right?)

Frequently Asked Questions for Digital Amateur Radio
(Well, it's still mostly just packet...)

$Id: packet-faq.1,v 1.4 1994/01/26 04:18:23 steve Exp $

This document is for unlimited distribution.

Please send corrections and additions to:
digital-faq@wattres.sj.ca.us
Which will expand to a list of people who are familiar with most digital
issues. I hope. ;-)

The Digital Radio FAQ list will be posted on a monthly basis to
rec.radio.amateur.digital.misc, rec.radio.info, rec.answers, and news.answers.
The current version of this document is available via anonymous FTP at
ftp.cs.buffalo.edu.

Many FAQ's, including this one, are available on the archive site
rtfm.mit.edu in the directory pub/usenet/news.answers. The name under
which a FAQ is archived appears in the Archive-Name: line at the top
of the article. This FAQ is archived as radio/amateur/digital-faq.

There is also a mail server on rtfm.mit.edu, which can be addressed as
mail-server@rtfm.mit.edu. For details on how to operate this server,
send a message to that address with the word "help" in the BODY of the
message.

1 Basic Packet Radio Information

1.1 What is packet radio?

Packet radio is one method of digital communications via amateur radio. Packet radio takes any digital data stream and sends that via radio to another amateur radio station. Packet radio is so named because it sends the data in small bursts, or packets.

1.2 What is amateur radio?

Amateur Radio (sometimes called Ham Radio) is individuals using specified radio frequencies for personal enjoyment, experimentation, and the continuation of the radio art. Amateur radio operators must be licensed by their government. In the United States, the Federal Communications Commission issues amateur radio licenses. Normally, a test on operating practices, radio theory, and in some cases Morse code proficiency test is administered. Amateur radio is not to be used for commercial purposes. Also, amateur radio operators are restricted from using profanity and using amateur radio for illegal purposes.

For more information on Amateur Radio in general, see the monthly frequently asked questions (FAQ) posting in rec.radio.amateur.misc. A copy of that FAQ is also available for FTP from ftp.cs.buffalo.edu and by mail from rtfm.mit.edu.

1.3 What can I do on packet radio?

Keyboard-to-Keyboard contacts:

Like other digital communications modes, packet radio can be used to talk to other amateurs. For those who cannot use HF frequencies, two amateurs can talk to each other from long distances using the packet radio network.

Packet BBS operations:

Many cities have one or more packet Bulletin Board System (BBS) available on the local packet network. Amateurs can check into the BBSes and read messages from other packet users on almost any topic. BBSes are networked together over the packet network to allow messages to reach a broader audience than just your local BBS users. Private messages may also be sent to other packet operators, either locally or who use other BBSes. BBSes have the latest ARRL, AMSAT, and propagation bulletins. Many BBSes have a file section containing various text files full of information on amateur radio in general.

DX Packet Cluster:

A recent development is use of packet radio for DX spotting. HF operators connect to the local DX Packet Cluster for the latest reports on DX. Often a user will 'spot' some hot DX and distribute the DX report real time.

File Transfer:

With special software, amateurs can pass any binary files to other amateurs. Currently, this is done with TCP/IP communications, YAPP, and other specialized protocols.

Satellite Communications:

Many of the amateur radio satellites contain microcomputer systems that can provide special information to amateurs. Some satellites contain CCD cameras on board and you can download images of the earth and the stars. Others provide store and forward packet mailboxes to allow rapid message transfers over long distances. Some satellites use AX.25, some use special packet protocols developed for satellite communications. A few transmit AX.25 packets over FM transmitters, but most use SSB transmissions.

1.4 Why packet over other digital modes?

Packet has three great advantages over most of the other digital modes: transparency, error correction, and automatic control.

The operation of a packet station is transparent to the end user; connect to the other station, type in your message, and it is sent automatically. The Terminal Node Controller (TNC) automatically divides the message into packets, keys the transmitter and sends the packets. While receiving packets, the TNC automatically decodes, checks for errors, and displays the received messages. In addition, any packet TNC can be used as a packet relay station, sometimes called a

digipeater. This allows for greater range by stringing several packet stations together.

Packet radio provides error free communications because of built in error detection schemes. If a packet is received, it is checked for errors and will be displayed only if it is correct.

With VHF/UHF packet, many countries allow packet operators to operate in automatic control mode. This means that you can leave your packet station on constantly. Other users can connect to you at any time they wish to see if you are home. Some TNC's even have Personal BBSes (sometimes called mailboxes) so other amateurs can leave you messages if you are not at home.

The most important advantage of packet over other modes is the ability for many users to be able to use the same frequency channel simultaneously. No other digital mode yet gives this ability.

1.5 What elements make up a packet station?

TNC (Terminal Node Controller): A TNC contains a modem, a CPU, and the associated circuitry required to convert between RS-232 and the packet radio protocol in use. It assembles a packet from some of the data on the serial line, computing an error check (CRC) for the packet, modulates it into audio frequencies, and puts out appropriate signals to transmit that packet over the connected radio. It also reverses the process, translating the audio that the connected radio receives into a byte stream on the RS-232 port.

Most TNC's currently use 1200 BPS (bits per second) for local VHF and UHF packet, and 300 BPS for longer distance, lower bandwidth HF communication. Higher speeds are available for use in the VHF, UHF, and especially microwave region, but they often require unusual hardware and drivers.

Computer or Terminal: This is the user interface. A computer running a terminal emulator program, a packet-specific program, or just a dumb terminal can be used. For computers, almost any phone modem communications program can be adapted for packet use, but there are also customized packet radio programs available.

A radio: For 1200 BPS UHF/VHF packet, commonly available narrow band FM voice radios are used. For HF packet, 300 BPS data is used over single side band modulation. For high speed packet (anything greater than 1200 BPS), special radios or modified FM radios must be used.

1.6 What do you mean we can all use the same channel?

Packet radio uses a protocol called AX.25. AX.25 specifies channel access (ability to transmit on the channel) to be handled by CSMA (Carrier Sense Multiple Access). If you need to transmit, your TNC monitors the channel to see if someone else is transmitting. If no one else is transmitting, then the TNC keys up the radio, and sends its

packet. All the other stations hear the packet and do not transmit until you are done. Unfortunately, 2 stations could accidentally transmit at the same time. This is called a collision. If a collision occurs, neither TNC will receive a reply back from the last packet it sent. Each TNC will wait a random amount of time and then retransmit the packet.

In actuality, a more complex scheme is used to determine when the TNC transmits. See the "AX.25 Protocol Specification" for more information.

1.7 What is AX.25?

AX.25 (Amateur X.25) is the communications protocol used for packet radio. A protocol is a standard for how two computer systems are to communicate with each other, somewhat analogous to using business format when writing a business letter. AX.25 was developed in the 1970's and based of the wired network protocol X.25. Because of the difference in the transport medium (radios vs. wires) and because of different addressing schemes, X.25 was modified to suit amateur radio's needs. AX.25 includes a digipeater field to allow other stations to automatically repeat packets to extend the range of transmitters. One advantage of AX.25 is that every packet sent contains the sender's and recipient's amateur radio callsign, thus providing station identification with every transmission.

1.8 What is RTTY?

RTTY (Radio TeleTYpe) is one of the more common communications protocols used in the HF bands. It is a half-duplex, non error-correcting mode that can be used by any number of stations on a frequency in a round-table fashion. Note that transmit/receive switching is manual, so all parties in a roundtable need to agree on who transmits next. It is primarily used for single keyboard-to-keyboard contacts. RTTY uses Baudot character encoding (also known as ITA2), which is a 5 bit code. Those who can do advanced math ;) will note that 5 bits is only 32 possible combinations, which is not enough for a full alphanumeric set, much less mixed-case alphabetics. Baudot (and RTTY) gets around this limitation by defining two "shifts" which switch between a "letters case," and a "figures case." On older RTTY setups (ones which actually use a teletype, for instance), you have to worry about the letters/figures shift. However, most TNCs and multimode digital controllers now do the "Right Thing(TM)" with respect to those shift characters, sending them as necessary for the data being transmitted. Lower case is not used on Baudot RTTY. ASCII can be used in RTTY as well, but it is very uncommon.

1.9 What is AMTOR?

AMTOR (AMateur Teleprinting Over Radio) is an error-correcting protocol used in the HF bands. It uses the same character set as Baudot (ITA2), but is encoded differently, so that each character has a constant mark to space ratio. This constant ratio is how errors are detected. Errors

are corrected via either of two methods: ARQ (Automatic Retransmit reQuest), and FEC (Forward Error Correction).

In ARQ mode, exactly two stations connect to each other. The station with data to transmit (also known as the Information Sending Station, or ISS) transmits 3 characters, and then waits for the other station (called the Information Receiving Station, or IRS) to send back an acknowledgment that those 3 characters were correctly received. This back-and-forth activity makes for the characteristic "chirp-chirp-chirp" of AMTOR ARQ operation. This also means that each transceiver needs to be able to switch from sending to receiving mode fairly quickly. The first time that you operate AMTOR ARQ with a relay-switched rig, you will be convinced that the rig is going to self-destruct. ;)

In FEC mode, one station can communicate with many others at once, since there is no back-and-forth acknowledging of data. FEC gets its error correction from time diversity, which is a fancy way of saying it sends each character twice. Actually, it interleaves the characters, so that the character is not repeated until 4 character times later. An example:
The text string to send is "This is FEC."
What comes out of the controller looks like "ThisThisis Fis FEC._EC._"
The receiving controller looks for which of the characters have a proper mark to space ratio, and prints the one that does. If neither do, it prints an error symbol.

1.10 Definitions: Commonly used terms in Amateur Packet Radio

44 net - The class A network designator for TCP/IP amateur packet radio. All numerical TCP/IP addresses on packet radio should be in the format 44.xxx.xxx.xxx.

AFSK - Audio Frequency Shift Keying. A method of representing digital information by using different audio frequencies modulated on a carrier.

AMPR - Amateur Packet Radio.

ampr.org - The high level domain recognized on Internet for amateur packet radio TCP/IP.

AMTOR - AMateur Teleprinting Over Radio. This protocol allows error-free point-to-point or multicast, single user per channel communications. Usually used on HF, but not VHF or above.

ARQ - Automatic Resend reQuest. This is the point-to-point error correcting mode for AMTOR. It works by sending bursts of 3 characters, and then the other station sends an OK/NotOK code for those 3 characters.

AX.25 - Amateur X.25 protocol. The basis of most packet systems.
See section 1.7 for more information.

CRC - Cyclic Redundancy Check. The error detection scheme included in each packet. Verify that the packet was received error free.

CSMA - Carrier Sense Multiple Access. A system allowing many stations to use the same radio frequency simultaneously for packet communications.

digi - Short name for a digipeater

digipeater - A packet radio station used for repeating packets. See section 3.3.1 for more information.

FCC - Federal Communications Commission. Regulates and issues licenses for amateur radio in the United States.

FEC - Forward Error Correction. This is the multicast method of (almost) error-corrected communications on AMTOR. It works by sending each character twice.

FM - Frequency Modulation. The radio modulation scheme used for VHF and UHF packet communications.

FSK - Frequency Shift Keying. A method of representing digital information by shifting the radio carrier frequency different amounts to represent ones and zeros.

HDLC - (High-Level Data Link Control Procedures) A standard for high level link control. (ISO 3309)

KA9Q NOS - (KA9Q Network Operating System) A TCP/IP program originally developed by Phil Karn, KA9Q. Currently there are many different versions available. See section 3.2 for more information.

KA-Node - A simple networking scheme developed by TNC maker Kantronics. See section 3.3.2 for more info.

KISS - Keep It Simple Stupid. A simple interface developed for communications between TNCs and computers. This allows for most of the packet processing to be handled by the computer. Commonly used with packet TCP/IP software.

LAN - Local Area Network. A packet network developed for communications throughout a city or region. Often, the LAN uses separate frequencies from inter-city packet links.

modem - MODulator/DEModulator. Converts the analog signals into a binary data stream (a series of ones and zeros) for the TNC or a micro-computer. First step in decoding packets. It also converts binary data to analog, which is the last step in encoding packets.

NET/ROM - A scheme for packet radio networking. See section 3.3 for more information.

NODE - A network node. Often a network node running NET/ROM.

PPP - Point to Point Protocol. PPP is another protocol used for moving IP frames over a serial line. It supports host authentication, and non-transparent serial lines. It also has a standard way of negotiating header (and potentially data) compression over the line. See also SLIP.

protocol - A standard used for intercommunication between different computer systems.

RS-232 (RS-323C) - A (more or less) standard for interconnection of serial peripherals to small computer systems. In packet radio, RS-232 is the most common interface between TNC's and the Computer/Terminal.

RTTY - Radio TeleTYpe. This protocol allows point-to-point or multicast, single user per channel communications, without error correction.

SLIP - Serial Line Internet Protocol. A trivial protocol for putting IP frames over a serial line to do (potentially) cheap TCP/IP networking. Approximately the same as KISS, except over wireline networks. See also PPP.

SSB - Single Side Band. The radio modulation scheme used for HF packet and satellite packet communications.

TAPR - Tucson Amateur Packet Radio. Was the first group to create a packet radio TNC using AX.25. Soon a TAPR TNC became cloned by many others. TAPR continues development of packet radio equipment.

TCP/IP - Transmission Control Protocol/Internet Protocol. A set of utility programs used over AX.25. See sections 3.2 for more information.

TNC - Terminal Node Controller. See section 1.5 for more information.

1.12 Do's and Don'ts : Rules and Regulations

NOTE: These regulations apply only to amateurs regulated by the FCC (United States), but often are similar to regulations in other countries.

[Since I have no experience with amateur radio in other countries, I cannot make any comments. Please bring any notable exceptions to my attention. -ed]

Although there are no specific rules that apply to amateur packet radio, the general amateur radio rules force some restrictions on packet usage.

Can I set up a TNC at home and one at work so I can check my Electronic mail via packet?

This cannot be done without special restrictions. Amateur radio rules prohibit any business. Since you could have mail from your boss (or maybe even someone selling you something over Internet), that would constitute business activity and is specifically prohibited.

Profanity can also be a complication. Since you have no control over the language used in E-mail, proper filtering is required. Since no filter scheme can catch every offense, it is best to say every

message must be hand filtered.

I would like to set up a packet radio gateway between a land line computer network and the packet network. Is this possible?

Yes, and there are several such gateways in use, but they must be managed with caution. Electronic mail may be passed FROM the packet network INTO the land line network without intervention. However, mail passed TO packet radio is considered third party traffic (the sender is not an amateur) and these messages must be hand filtered to ensure that rules of message content are followed.

It's my license if I use packet radio illegally anyway, so what does anyone else care!?

Packet radio is one of the few NETWORKED systems in amateur radio. Many people have helped develop the network and there are many amateurs who own parts of the packet radio network. Sending packet BBS mail, digipeating, and sharing the channel involves the licenses of MANY people. Because of FCC rules stating that anything to come out of a transmitter (either in automatic mode or via your direct control) is the licensee's responsibility, one illegal message sent over the packet radio network could literally jeopardize the licenses of thousands of other amateurs. When in doubt, it is best to check with other amateurs about sending the message before it is sent.

I have some ideas on how to use packet radio in a new way, but I don't know if it is legal. Who could tell me if I can do it legally?

The worst thing you can do is talk to the FCC about such an issue. The FCC rules are written to be general enough to encompass but not restrict new radio activities. In the past, any non-thought-out requests sent to the FCC have meant a reduction of privilege for all amateur radio operators.

The best source for legal assistance is your national amateur radio association. In the United States, that is the American Radio Relay League (ARRL). Another good place for such conversations is over Usenet/packet mailing lists, or the amateur radio BBS network.

2 Computing Network Resources for Amateur Packet radio

This section summarizes the resources available on Internet for amateur packet radio operators.

2.1 What Newsgroups/mailing lists are available?

This is a list of all groups that regularly discuss amateur packet radio. For newsgroups, join the group through use of your news reader. For mailing lists, add a '-request' to the end of the list name to request subscriptions. For listserv groups, send mail to 'listserv' at the node which contains the list. The first line of the mail should be 'SUBSCRIBE groupname yourname'. Send the command 'help'

for more information.

rec.radio.amateur.packet (Newsgroup): General discussions involving Packet Radio. This group was deleted on 21 September 93!

rec.radio.amateur.digital.misc (Newsgroup): General discussions about all aspects of digital transmissions over Amateur Radio. This group is a replacement for rec.radio.amateur.packet.

rec.radio.amateur.equipment (Newsgroup): May contain discussions about equipment related to digital amateur radio, specifically HF rigs that are good for HF digital modes, and the like.

rec.radio.amateur.homebrew (Newsgroup): Contains discussions on making your own gear, which includes packet, AMTOR, and RTTY equipment.

rec.radio.amateur.misc (Newsgroup): General amateur radio discussion. Usually does not contain any particular information about Digital Amateur Radio.

rec.radio.amateur.policy (Newsgroup): Discussion of regulation policies regarding every aspect of amateur radio. Occasionally deals with policies of packet coordination and legal issues of packet radio.

rec.radio.swap (Newsgroup): General For-Sale for any radio equipment. Occasionally will have packet equipment for sale. Recommended location for any amateur packet radio for-sale items.

info-hams@ucsd.edu (Listserv group): A digest redistribution of the rec.radio.amateur.misc Usenet discussion.

packet-radio@ucsd.edu (Listserv group): General discussions involving packet radio and packet-related issues.

ham-digital@ucsd.edu (Listserv group): A digest redistribution of the rec.radio.amateur.digital.misc Usenet discussion.

ham-policy@ucsd.edu (Listserv group): A digest redistribution of the rec.radio.amateur.policy Usenet discussion

hs-modem@wb3ffv.ampr.org (Mailing list): Discussion of high speed modems and radios available and future plans. Also includes discussion of networking using high speed modems. This list is not very active.

tcp-group@ucsd.edu (Mailing list): Group discussion of technical developments of TCP/IP over packet radio and use of the NOS TCP/IP programs.

gateways@uhm.ampr.org (Mailing list): Discussion of current gateways and future plans for gateways. May deal with sensitive internetworking issues.

listserv@knuth.mtsu.edu has several interesting mailing lists available:

GRAPES-L Discussions with GRAPES (Georgia Radio Amateur
Packet Enthusiasts Society) on 56kb WAN's and
the WA4DSY 56kb RF modem that they distribute.

TENNET-L Tennessee's efforts at a coordinated high-speed
RF packet network

GRACILIS-L Discussions on Gracilis tcp/ip packet equipment.
Includes some of the people from Gracilis.

KA9Q-UNIX Discussions on porting and using various versions
of KA9Q Unix/Xenix NET/NOS under any of a variety
of Unix/Xenix variants.

TNV-HAMS General discussions among email connected
amateur radio operators in and surrounding
Tennessee

Send a message with a body of "HELP" to get help from the list server. Also,
Internet users may now INTERACTIVELY work with the Listserv there by:

telnet knuth.mtsu.edu 372

or

telnet 161.45.1.1 372

For all lists at ucsd.edu, archives may be found via anonymous FTP at
ucsd.edu. Some listserv groups also have archives. Send the command
'help' to the group's listserv for more information. Digest mailings
for the ucsd.edu discussions are also available. Send mail to
listserv@ucsd.edu with the first line being 'longindex' for more
information.

Terry Stader (KA8SCP) <tstader@aol.com> maintains a list of Mac
packet-related software, and posts it periodically (somewhat less often
than monthly) to rec.radio.amateur.digital.misc.

Carl Trommel <carl@codewks.nacjack.gen.nz> posts the weekly news bulletin
of the ZL Data Group to rec.radio.amateur.digital.misc. This bulletin
covers the current happenings in New Zeland's packet network.

There appears to be a mailing list about NOS on hydra.carleton.ca, but
I don't have much more detail. Send a message to
nos-bbs-request@hydra.carleton.ca. The list name is nos-bbs@hydra.carelton.ca.

2.2 What anonymous FTP sites and electronic mail servers are available
for getting packet radio information and programs?

This is a sampling of FTP sites that carry amateur packet radio related
files. Consult the Archie archive server for info on locating
particular files. For more information on using Archie, send mail to
archie@cs.mcgill.edu with the line 'help'.

ucsd.edu

Primary distribution site of KA9Q's derived TCP/IP packages. Also,
general packet radio information in the /hamradio/packet subdirectory.
UCSD is also the home of the Amateur Radio "Requests For Comments"
directory. If you write something that you believe could be included
in this directory (for example, a specification of AX.25, or maybe some
other protocol that nobody's thought of before) contact Brian Kantor
(brian@ucsd.edu) and let him know.

wuarchive.wustl.edu

Very large collection of amateur radio software. This stuff used to
be on wsmr-simtel20.army.mil, but that system (and service) was
discontinued as of 1 Oct 93 for budgetary reasons. WUArchive used
to "just" mirror Simtel20, and still has all the files that were
on Simtel20 when it shut down.

ftp.cs.buffalo.edu

Supplemental archive site for amateur radio information. Contains
current copies of all rec.radio.amateur.* FAQ's.

tomcat.gsfc.nasa.gov

Packet software including Baycomm, ROSE, G8BPQ, NOS, etc.
(I have one report (from George Hitz, W1DA) that this FTP site will be
down until the end of this summer, 1993. Reportedly the site admin is
going to be in Sweden.)

akutaktak.andrew.cmu.edu

SoftKiss for the Mac, in /aw0g. Requires NET/Mac.
SoftKiss is an init/cdev/driver that allows a MAC to do packet using
a Poor Man's Packet modem.

sumex-aim.stanford.edu

NET/Mac is the port of KA9Q's NET program. It doesn't have nifty features
like scrolling or saving the windows, but the individual sessions can be
recorded into a file.

As for mail servers, there is only one that I know of at the moment:

Ham-Server@GRAFex.Cupertino.CA.US

This mail server, which is run by Steve Harding (KA6ETB), has a wide
variety of information on most aspects of amateur radio, not just digital
modes. Send a message with the body HELP to get a fairly useful listing.
Also note that Steve posts the index from the server approximately weekly
to rec.radio.amateur.misc, rec.radio.amateur.digital.misc, and sbay.hams.

2.3 How do I contact the ARRL via electronic mail?

There are various addresses at ARRL HQ, but the most important one is
probably info@arrl.org. That is where general information about the
ARRL can be acquired. This address reaches a person, so you'll have
to specify what/who you're looking for.

2.4 Are there any gateways for mail or news between Internet and
Amateur Packet radio?

Internet / Packet Radio BBS Gateways

There are currently two comprehensive gateways between the Internet and
the packet radio BBS system. One is run by Jim Durham, W2XO, in Pennsylvania
and the other, which allows access to PBBS bulletins, as well as mail,
is run by Bob Arasmith, N0ARY, in California.

2.4.1 The W2XO Gateway

To mail from Internet to Packet:

1. Mail to: "bbs@w2xo.pgh.pa.us"

2. Make the first line of the text a Packet BBS "send" command, i.e.:
SP TOCALL @ BBSCALL.ROUTING-HINTS < FROMCALL

3. The "subject" line of the Internet mail becomes the "title" line
of the Packet BBS mail.

NOTE: Because of FCC regulations, Jim must hand filter each message
sent FROM Internet TO the Amateur Packet Radio BBS system. Messages
should be of minimal length and appropriate content. Read Section 1.9
(Do's and Don'ts: Rules and Regulations) regarding appropriate usage of
packet radio for more information. Always include the routing hints
with the BBS callsign.

To mail from Packet to Internet:

1. The amateur radio operator must have his callsign registered in
the gateway alias list. If you want to mail from packet to a specific
amateur on Internet, send mail to 'durham@w2xo.pgh.pa.us' (Internet) or
'W2XO @ W2XO.#WPA.PA.USA.NOAM' (Packet BBS mail) with his/her amateur
callsign and their Internet address.

2. Once the above is accomplished, packet BBS mail should be sent to
'CALL @ W2XO.#WPA.PA.USA.NOAM'. The mail will automatically be
forwarded to the Internet address of the amateur with the 'CALL'
callsign.

Jim Durham's Internet address is 'durham@w2xo.pgh.pa.us'.

2.4.2 The N0ARY Internet mail <-> full packet BBS gateway

Bob Arasmith, N0ARY, runs a gateway between the Internet mail system and
the PBBS system. His gateway allows you to read, post, and respond to other
postings on the PBBS system via email. For more information, send mail
to gateway_info@arasmith.com.

2.4.3 The N6QMY Internet mail <-> full packet BBS gateway

Patrick Mulrooney, N6QMY, also runs a gateway between the Internet mail
system and the PBBS system. His gateway allows you to read, post, and
respond to other postings on the PBBS system via email. For more

information, send mail to gateway-info@lbc.com.

Users are required to register with the gateway to allow automatic forwarding of mail from the Internet to Packet. No registration is needed to send mail from Packet to the Internet. To register, send the following information to gateway-request@lbc.com:
CALL:
FIRST NAME:
LAST NAME:
CITY & ST:
COUNTRY
ZIP:
HOME BBS:

2.4.4 LAN Gateways (Packet wormholes via Internet)

Currently a group of amateurs are experimenting with connecting packet LANs together via Internet IP inside IP Encapsulation. Some of the gateways only accept TCP/IP packets, others AX.25 packets. These gateways uses the Internet as a transport medium, thus it is impossible to access the packet radio network from Internet. For more information, join the Gateways mailing list by sending mail to "gateways-request@uhm.ampr.org".

2.5 How do I contact TAPR?

The only route I currently know if is via USnail and telephone.

USnail:
TAPR (Tuscon Amateur Packet Radio)
8987-309 E. Tanque Verde Rd. #337
Tuscon, AZ 85749-9399

Telephone:
Voice: +1 817 383 0000
Fax: +1 817 566 2544

3 Networking and special packet protocols

This is a sample of some of the more popular networking schemes available today. By far, there are more customized networking schemes used than listed. Consult your local packet network guru for specific network information.

3.1 Are there any other protocols in use other than AX.25?

AX.25 is considered the defacto standard protocol for amateur radio use and is even recognized by many countries as a legal operation mode. However, there are other standards. TCP/IP is used in some areas for amateur radio. Also, some networking protocols use other packet formats than AX.25.

Often, special packet radio protocols are encapsulated within AX.25 packet frames. This is done to insure compliance with regulations

requiring packet radio transmissions to be in the form of AX.25. However, details of AX.25 encapsulation rules vary from country to country.

3.2 What is TCP/IP?

TCP/IP stands for Transmission Control Protocol/Internet Protocol. This is commonly used over the Internet wired computer network. The TCP/IP suite contains different transmission facilities such as FTP (File Transfer Protocol), SMTP (Simple Mail Transport Protocol), Telnet (Remote terminal protocol), and NNTP (Net News Transfer Protocol)

TCP/IP doesn't use all of the AX.25 protocol. Instead, it uses special AX.25 packets called Unnumbered Information (UI) packets and then puts its own special protocol (called IP) on top of AX.25. This is used to increase efficiency of its transmissions, since IP does not require packets to be "reliable", that is to say, guaranteed delivered error-free. TCP handles the retransmission of lost and garbled packets in its own way, at a higher level. Therefore the extra information in an AX.25 "VC" (virtual circuit) frame is not useful, and thus consuming needed bandwidth.

The KA9Q NOS program (also called NET) is the most commonly used version of TCP/IP in packet radio. NOS originally was written for the PC compatible. However, NOS has been ported to many different computers such as the Amiga, Macintosh, Unix, and others. Smaller computers like the Commodore 64 and the Timex-Sinclair do not currently have version of NOS available.

For more general information about IP (not necessarily over packet radio), try the newsgroup comp.protocols.tcp-ip, and any of the plethora of books on the subject. I have found the various books by Douglas Comer (the "Internetworking with TCP/IP series) to be excellent.

3.3 How do I get an IP address?

Brian Kantor (brian@ucsd.edu) is the IP address coordinator for the AMPR.ORG domain, also known as the "44 net." Brian (sensibly enough) delegates coordination for each state to sub-coordinators. This list(*) of coordinators is available via FTP from ftp.cs.buffalo.edu:/pub/ham-radio/ampr_coordinators.

(*) The coordinator list doesn't have e-mail addresses. If you're willing to do the legwork required to gather them, please contact Brian Kantor.

3.4 Networking Schemes

What are some of those other networking schemes?

During the early days of amateur packet radio, it became apparent that a packet network was needed. To this end, the following packet network schemes where created.

Digipeaters

The first networking scheme with packet radio was Digipeaters. Digipeaters would simply look at a packet, and if its call was in the digipeater field, would resend the packet. Digipeaters allow the extension of range of a transmitter by retransmitting any packets addressed to the digipeater.

This scheme worked well with only a few people on the radio channel. However, as packet became more popular, digipeaters soon were clogging up the airwaves with traffic being repeated over long distances. Also, if a packet got lost by one of the digipeaters, the originator station would have to retransmit the packet again, forcing every digipeater to transmit again and causing more congestion.

KA-Nodes

Kantronics improved on the digipeater slightly and created KA-Nodes. As with digipeaters, KA-Nodes simply repeat AX.25 frames. However, a KA-Node acknowledges every transmission each link instead of over the entire route. Therefore, instead of an end-to-end acknowledgment, KA-Nodes allow for more reliable connections with fewer timeouts, because acknowledgments are only carried on one link. KA-Nodes therefore are more reliable than digipeaters, but are not a true network. It is similar like having to wire your own telephone network to make a phone call.

NET/ROM

NET/ROM was one of the first networking schemes to try to address the problems with digipeaters. A user connects to a NET/ROM station as if connecting to any other packet station. From there, he can issue commands to instruct the station to connect to another user locally or connect to another NET/ROM station. This connect, then connect again, means that to a user's TNC, you are connected to a local station only and its transmissions do not have to be digipeated over the entire network and risk loosing packets. This local connection proved to be more reliable.

NET/ROM is a commercial firmware (software put on a chip) program that is used as a replacement ROM in TAPR type TNC's. Other programs are available to emulate NET/ROM. Among them are TheNet, G8BPQ node switch, MSYS, and some versions of NET.

NET/ROM nodes, at regular intervals, transmit to other nodes their current list of known nodes. This is good because as new nodes come on-line, they are automatically integrated in the network. However, if band conditions such as ducting occur, ordinarily unreachable nodes can be entered into node lists. This causes the NET/ROM routing software to choose routes to distant nodes that are impossible. This problem requires users to develop a route to a distant node manually defining each hop instead of using the automatic routing feature.

ROSE

ROSE is another networking protocol derived from X.25. Each ROSE node has a static list of the nodes it can reach. For a user to use a ROSE switch, he issues a connect with the destination station and in the digipeater field places the call of the local rose switch and the distant rose switch the destination station can hear. Other then that, the network is completely transparent to the user.

ROSE's use of static routing tables ensures that ROSE nodes don't attempt to route packets through links that aren't reliably reachable, as NET/ROM nodes often do. However, ROSE suffers from the inability to automatically update its routing tables as new nodes come online. The operators must manually update the routing tables, which is why ROSE networks require more maintenance.

3.5 BBS message transfer

Many of the BBS programs used in packet radio allow for mail and bulletins to be transferred over the packet radio network. The BBSes use a special forwarding protocol developed originally by Hank Oredsen, W0RLI.

Besides full service BBSes, many TNC makers have developed Personal BBS software to allow full service BBSes to forward mail directly to the amateur's TNC. This allows operators to receive packet mail at night and avoid tying up the network during busy hours.

279. Older version of view.exe needed

Newsgroup: rec.radio.amateur.digital.misc

280. KISS mode problems with Tiny 2 (DCD)

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-01-26 07:47:48 UTC
From: DEJ7265@tntech.edu
Message-ID: <01H84DI3PIXKDRPZCG@tntech.edu>
Source record: 50372

I have a problem with my PacComm Tiny 2 in KISS mode. The TNC seems to be in FULL Duplex mode while in KISS mode. I have set PARAM 5 to 0 but the TNC will still key when the DCD is activated. The TNC will not key when the DCD is activated if it is in normal command mode.

Is this a problem already found? And if so has PacComm fixed this in later versions of their EPROM ? My version information is...

Release P1.1.6D4 September 18, 1990 - 32K RAM

Oh yes, it's a famous bug in 1.1.6D4

Most of my locals have reverted to 1.1.6C1 to get around this problem.
The UK agents don't have a later version of the code :-(

The same bug also exists in the TNC-220 version of the Pac-Comm 1.1.6D4
as well - same fix applies, revert to 1.1.6C1.

Incidently all the TNC-220 Pac-Comm code seems to lock up in KISS mode
if data is received on the radio port whilst the TNC is doing the "LED
dance" at power-up.
I've just hacked the LED dance out of the code I'm using on the TNC-220
and it is a lot better, but will still lock up if noise is received
whilst the TNC is powering up.
I know a couple of people who've tried the "220KISS" ROM from G8BPQ,
but none of us can get the TNC to =ever= transmit anything. Perhaps
it's a new way to relieve channel congestion??

Source record: 50384

I'm very interested in digital radio. I've taken several graduate EE coarses in digital communications, so I have a decent grasp of the theory. However, I have no real-world experience with radio. It looks like digital amateur radio might be just the ticket. Are there any seasoned amateurs out there who can help me get started? (I already read the FAQ)

Who do I contact to get a license? Is there a test? Do I have to know morse code?

Where can I learn more about the equipment used? How much will it cost? Is it realistic to design and build some of it myself? I think I would learn more that way.

Are there any digital radio operators in the Dallas area that would be interested in giving me a demo?

I was just wondering if there is a database out on Internet somewhere that can correlate call signs with an e-mail address? In other words, I think it would be incredibly useful to be able to access a database like the call sign servers which would also tell you the ham's e-mail address (if he/she has one). Might be tough to maintain, but it would sure make it easy to get in contact with someone having only their call sign.

Just wondering.

WAMPES, an updated version of ka9q works fine under Linux. If you have
problems with configuration scripts, send E-Mail to the maintainer of
that code, Olaf Erb. His address is in the distribution of WAMPES.
You can get it from UCSD.edu /pub/hamradio/tcpip/wampes I think.

Also, Alan Cox, the maintaner of the networking code for Linux has just
released AX25 built into the kernel. If you like, I can send you a ready
built kernel, and the docs on how to get it going. Send me E-Mail if
you are interested in that. I think that's your best bet. It does
IP over AX25, and normal AX25 directly from the kernel to a KISS TNC.
I've had no problems at all.

Hi :

Our local ARES group is interested in adding packet radio capabilies to
our "toolkit". We've got a number of people who have used packet, but none
with lots of in-depth technical expertise.

There are a number of questions we've got to look at, including :
- is AX.25 or TCP/IP "better"?
- what is the "best" hardware and software?
- what sorts of things is packet best suited for, in an ARES context?
- how gracefully does the communication channel degrade as more users
are added?
- what sort of standard software packages are out there for ARES use?
- etc., etc., etc.

Any advice/comments/voice-of-experience would be greatly appreciated!
(I'd be willing to create & post a summary of the responses, if anyone
is interested in such a thing).

BTW, I'm an avid collector of manuals from other ARES groups, and am
always on the lookout for new ones! For those who are interested, I'll
gladly share a copy of ours and any others I've got (I have a few already).

Mike -

I am using the MFJ 1270B TNC with the MFJ implementation of the 9600 baud modem. I seems to work ok for the most part. The only complainrt I have is that the beast seems to change TXD/SLOT/PERSIST parameters on it's own while running in KISS mode. I haven't been able to get to MFJ with questions (their tech phone is always busy). I have a friend who is running the same version of JNOS as me (my EXE file is a copy of his) but with a Kantronics data engine and HIS parameters don't change. The KDE is a nice box biut is much more expen$ive than the MFJ box. If you don't mind some of your TNC parameters being jangled in KISS mode, the MFJ is at least worth a look...

295. New NET/Mac (hamradio TCP/IP) for the Macintosh

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-01-27 09:13:03 UTC
From: adam@igg.tno.NL
Message-ID: <9401270913.AA07751@iggcis1.igg.tno.nl>
Source record: 50387

The Netherlands, January 25, 1994.
Hello dear reader,

Today I distributed the file NET_Mac2.3.35.sea.hqx...

In this version of NET/Mac I implemented the following:

- New <dayofweek> parameter for 'perform' command
- New: 'reboot_on_bad_date' } These new commands were implemen-
- New: 'sourcewhendone' } ted to make it easier to maintain
- New: 'resetsmtpto' } an unattended slip-telephone-link
- Improved the generation of dynamic aliases
- Some more 'enhancements' for q-and-d AppleTalk-fix
- Some more 'enhancements' for q-and-d fix

This version obsoletes all versions of info-mac/comm/radio-netmac in the
Sumex-Aim archives.

The new NET/Mac has been uploaded to ucsd.edu, to the directory
/hamradio/packet/tcpip/incoming. If it's not there (anymore),
then look at /hamradio/packet/tcpip/mac.

Kind regards,

Adam PA2AGA (e-mail: adam@igg.tno.nl)
(or: pa2aga@igg.tno.nl for letters only, NO BIG files here)

It's not just at power up -- the same thing happens when entering KISS
from command mode. Once the LEDs have stopped flashing, there's no
problem.

That's right. He sent you the program for free. It didn't cost you anything other than the mailer and diskette. He is asking for a registration fee. Unless after the 30 days is up and your hard drive explodes, what is the problem?

>with lots of in-depth technical expertise.
>
>There are a number of questions we've got to look at, including :
> - is AX.25 or TCP/IP "better"?

AX25 is usually the link level frame protocol used in both cases. So TCP/IP is not in competition with AX25. TCP/IP goes beyond AX25 by adding advanced network, transport, and presentation protocols for handling complete packets or streams of information. Simple connected mode AX25 does this in a very limited fashion. With TCP/IP added above either datagram or virtual circuit AX25 link connections, much more complete and robust services become available. TCP/IP will also work with other link level frame protocols so it can also work over ethernets, dial up phone connections, etc as well as over radio. This allows you to setup mixed networks using any available link level media that may be available to you.

> - what is the "best" hardware and software?

That depends. If you have a PC, the Gracillis Packet Twin plug in card is the best digital interface. It'll handle any two of 300, 1200, 2400, 9600, 19.2 kb, or 56 kb modems. One of those (up through 9600 baud) can be an internal daughter card, the other external. The Ottawa PI card is a lower cost alternative. If you don't have a PC, or have a laptop with no internal slot, then you'll be forced to use an external TNC. For external dual channels and high speeds, only the Kantronics Data Engine will do, but be aware that the serial link to the computer or terminal you use will be a bottleneck to throughput. For lower speed dual channel external use, there's only the KAM. It uses proprietary firmware and non-standard hardware, however, that may pose a limitation. Most people use TAPR TNC2 compatable hardware, such as the MFJ1270, PacComm Tiny 2, etc that accept third party firmware and hardware add ons. If it doesn't use a Z80 processor and Z80SIO, it won't work with TAPR add ons. That eliminates all the various AEA and Kantronics offerings. They use proprietary architectures that limit your firmware options.

As to software, if you want the features of TCP/IP, then one of the varients of the KA9Q package, with their built in file transfer, Email delivery, and interactive keyboard servers, is your choice. If you're using a simple AX25 link level only system with an external TNC, then any general purpose communications program, such as Procomm, will work

fine.

> - what sorts of things is packet best suited for, in an ARES context?

Packet in general is best used as a bulk mail system to deliver hard copy
to various posts. It's good for H&W enquiries, good for lists of people
at shelters, good for logistic lists, etc. If in addition you have a
Packet Cluster node in the system, it can serve as a bulletin transport
to all stations in the network. Otherwise it is of little use for interactive
tactical communications. That's best left to VHF/UHF voice.

> - how gracefully does the communication channel degrade as more users
> are added?

That depends on the network physical architecture and on the details of
the chosen transport protocol. If a duplex repeater is available to
eliminate the hidden terminal problem, and if a p-persistance backoff
algorithm is used, then the network degrades gracefully under increasing
load. If simplex nets with digipeaters or nodes are used, and no backoff
algorithm implemented, then the channel is prone to congestive collapse
as the user load increases.

> - what sort of standard software packages are out there for ARES use?
> - etc., etc., etc.

There are query databaases available such as ARES Data that will let
you access the hazmat database. And the Packet Cluster software can
be useful in setting up flash bulletin systems. But in general, the
TCP/IP software can do all that you would want, from automated file
transfer to automatic Email handling to simple interactive keyboard
tasks. It does require a bit of user sophistication to setup, however.

Resetting KISS parameters after X minutes of channel inactivity
was a "feature" written into one version of the MFJ firmware.
If you don't like it, and most don't, simply replace the firmware
with any other TAPR ROM. Or if you're an exclusive user of the
KA9Q TCP/IP package, then replace it with the K3MC KISS only ROM.
That has the additional charm of allowing you to throw away the
memory battery and not worry about a power bump in the night
resetting your TNC out of KISS mode.

At our establishment we are starting to work on an expanded
robotic project. Our need is to look at the data link between a fixed control
station and a roving vehicle.
The data link we need should accept packet data from the rs232 port
and pass it via RF untouched to the robot. Data speeds need to be at least
19.2 Kbps. Coverage will be in the order of 5Km for 99.5% reliability.

Any suggestions ?????
Please post or e-mail any ideas.

306. AX.25 and Ham TCP/IP for Linux

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-01-28 06:07:28 UTC
From: jeff@ee.ryerson.ca
Message-ID: <2iaa30$17kt@hermes.acs.ryerson.ca>
Source record: 50301

Hi all. I have compiled up a Linux (Freeware UN*X) kernel 0.99pl14t
with GW4PTS' AX.25 stuff in. This package is great for anyone already
running Linux, and in most cases, replaces WAMPES or NET far better.

I will upload the package, wich contains binaries of the kernel and
the other required things to UCSD.edu /hamradio/packet/tcpip/incomming
GW4PTS.AX25.tar.gz

this morning. The package also explains where to get the source.

Basically, it implements AX.25 and KISS from the kernel, and of course,
you can use the standard Linux TCP/IP stuff too, over packet! I even had
an XWindow client running on a Sparc station, connected to my Linux X server
over packet!!!!! Really neet stuff! Check it out.

Several versions of the KA9Q package WILL run in a DOS window on Windows 3.1,
because I use one version regularly.

Well, it looks like perhaps the ad should have made it clear that it was
a copy for free evaulation for 1 month, rather than saying outright that
it was free. But if you paid $49.99 for it, I would say that you didn't
read enough to determine that, in fact, there's an introductory period
until May 1, 1994, during which time the shareware registration is
$39.99.

I suspect what is "free" is that the author will send you a copy, at no
cost, provding you send him a disk. (ie: he'll pay the postage).

The question is: Do you feel that the program is worth the money?

> Unless after the 30 days is up and your hard drive explodes, what is the
> problem?

Well, there are a couple of problems:

1) It's deceptive advertising. It should more properly have stated that it
was shareware, not free. Not a big deal, except ...

2) Based on the statement made by the author that the software was free, I
might have forwarded the message over packet. However, since the software
is in fact shareware, I *might* (note I said *might*) be in violation of
of the non-commercial use provisions of the rules and regulations under
which I operate my station (Canadian, not U.S.)

All in all it's not that big of a deal. He's guilty of bad marketing at worst.

From: P.J.Scott@bradford.ac.uk
Message-ID: <1994Jan29.141622.15723@bradford.ac.uk>
Source record: 50308

Hi,

I own a tiny2 and have the latest software which claims to have GPS support, but has no documentation about it.

Has anybody got the mode to do anything, (if you enter GPS mode it just locks the TNC up and needs to be reset), or know where to get information about it.

Also does anybody know where the hardware needed for GPS reception (ie the reciever) could be obtained.

Cheers

Paul.

318. RadFax 0.9 Question

From: acsys@crl.com
Message-ID: <2iej6n$mug@crl.crl.com>
Source record: 50314

I wan't to make a simple digital link, One of the ways I was tinking of doing it was using an MC2833 for the xmitter and a MC3363 for the receiver, my question is how do I modulate the transmitter, can I just run the logic voltage (0 or 5V) into the "mod in" of the xmitter chip? Or to I need to use AFSK? Would just running the logic voltage into the mod effectivly give me a low and high ouput from the mc3363's data slicer? I'd like not to use modem chips. And since I'm going to use uProcessors on each end I was hoping to use them for the timing etc. I want to know if this will work before I invest alot of time making a prototype that doesn't work.

Also what about using AM? what kind of simple modulation methods are simple for AM? Since AM receivers/transmitters are much cheaper to build.

Anyway I only need 300baud, but 1200 would be nice. I'm going to build this to operate on the 49MHz band, and I don't need more than about 1mw of power output since I only need about 50feet of range.

Any ideas would be appreciated.

Thanx in advance,

mycal

Hi Ed,

Last I heard, HC 3.0 is still in the works and under testing for some syncing problems. But expect lotsa fun with it. It has some nice new modes and changes which work beautifully. Then again, maybe it IS out. Who knows, I'll go ask Django.

Been using it for some time now and am happy based on the investment. Wish
they would come up with a file interchange routine like YAPP. Have been trying
to get TPK working with the Baypac, but so far no real success.

The GPS mode is designed so that you can connect the serial RS232 data
output of a GPS receiver to a TNC and packet radio, so that the packet
radio will continuously transmit the GPS signal by radio to another
location. The reason nothing happens when you enter the mode is that the
TNC is waiting for a specific data format from the GPS receiver, which
conforms to an industry standard.

As for suitable GPS receivers, check the back of aviation magazines.
The least expensive receivers do not have data ports.

PacComm sells the IPR-NB96 packet radio system, which comes standard at
9600 baud, but they will modify it for you for 19.2k for a small charge,
or you can do the modification yourself. It can probably handle higher
speeds, but I don't believe PacComm supports them. This comes with the
TEKK KS-900 data radio, and you can operate in both directions in simplex
mode, or simultaneously (full duplex) if you buy a second TEKK radio.
Cost per station is $510 US + $210 if you want a second transceiver. I
don't have their number right now, but it's in many of the amateur radio
magazines.

*** Welcome to rec.radio.info! ***

Welcome to rec.radio.info, a group that aims to provide a noise-free source
of information and news for the entire rec.radio hierarchy.

Two introductory articles about rec.radio.info are posted to the group and
to news.answers every two weeks. You are now reading the first article, which
explains what rec.radio.info is, and answers some Frequently Asked Questions.
The second article is titled "Submission Guidelines", and you only need to
read it if you want to submit an article to rec.radio.info.

You can skip to the next section of this article by searching for the next
" -- " string. The sections available are:
- What is the purpose of rec.radio.info?
- Why are messages almost always cross posted to rec.radio.info?
- What is a 'follow-up', and what does 'moderated' mean?
- OK, so now I know what 'moderated' means. Tell me more.
- What type of material is considered inappropriate?
- I do not have access to news, how can I get the information posted to
rec.radio.info?
- Will the material appearing in rec.radio.info be archived somewhere?
- I have a regular posting with timely information, is there a way to
speed up it's delivery, or automate for more convenience?

-- What is the purpose of rec.radio.info?

The purpose or charter of rec.radio.info is to provide the Usenet community with
a resource for information, news, and facts about any and all things radio.

All the other rec.radio groups are intended for discussions and general chit
chat about radio. Rec.radio.info will contain informational, factual articles
only. Follow-ups are redirected to an appropriate other group, and further
discussion (if any) will not take place in rec.radio.info.

In order to ensure that rec.radio.info contains only appropriate articles, it
was decided to create the group as a moderated newsgroup.

-- Why are messages almost always cross posted to rec.radio.info?

It provides a "tag" for each article to be assembled into a filtered
presentation in rec.radio.info (even with cross-posting, only one message, with
```

a unique Message-ID, is propogated across the net). This tag also facilitates a pre-existing method of dropping or cancelling the articles locally within the discussion groups if you don't want to see them. This accommodates individuals who want to separate the bulletins from the discussions, discussions from the bulletins, as well as those who are adamant about not reading another newsgroup and wanted to see everything all in one basket.

With the total size of Usenet (in number of newsgroups and total traffic) doubling every year or so, this is no insignificant contribution to reducing information noise and chaos. Making the discussion groups a catch-all, and making extra newsgroups filters on that catch-all, is also the most realistic way to implement such a scheme (It's not intuitively obvious what the charter, contents, and general appropriate topics for each and every newsgroup are. Seeing FAQ's and charter/intro postings in the home newsgroup is beneficial for new readers).

By cross-posting one only is adding a few tens of bytes to each bulletin (to specify the extra group on the Newsgroups line), but are adding the capability for very powerful filtering features available on most news servers, listservers and readers. Your local news guru could probably explain these features in more detail.

In rn, for example, according to Leanne Phillips in her rn kill-file FAQ, add a line of the form:
/Newsgroups:.*[,]rec\.radio\.info/h:j
either in ~/News/KILL (if you don't want to see rec.radio.info articles anywhere) or ~/News/rec/radio/amateur/misc/KILL (if you don't want to see them just in rec.radio.amateur.misc). The latter method means your kill file will only be consulted during rec.radio.amateur.misc (and hence runs more efficiently), and will probably work for most people.

In nn, according to Bill Wohler in his nn FAQ, add a line of the form:
rec.radio.info:!s/:^
in ~/.nn/kill (if you don't want to see rec.radio.info articles anywhere), or put the following lines:
sequence
rec.radio.info
rec.radio.
at the end of ~/.nn/init in order to see all the rec.radio.info bulletins first, then read the remaining rec.radio.* without the bulletins.

-- What is a 'follow-up', and what does 'moderated' mean?

If you are new to Usenet and are not familiar with the terminology, you might want to read the general introductory articles found in the newsgroup news.announce.newusers. Doing so will make your life on the net much easier, and will probably save you from making silly beginner's mistakes.

If you think that at this moment you are reading an echo, a conference, or a bulletin board, I'd also strongly suggest a trip over to news.announce.newusers.

For the rest of this article, I will assume you have a basic knowledge of Usenet terminology and mechanics.

A moderated group means that any article that needs to be posted to the group has to be accepted by the moderator of the group. Since we need to ensure that followups to an article (discussion) do not show up in the rec.radio.info newsgroup, the `Followup-To:' header line contains a newsgroup that is appropriate for disussions about the specific article.

-- OK, so now I know what 'moderated' means. Tell me more.

Rec.radio.info is a moderated newsgroup, which means that all articles submitted to the group will have to be approved by the moderator first.

The current moderator of the group is Mark Salyzyn. Submissions to rec.radio.info can be posted, or e-mailed to:

rec-radio-info@ve6mgs.ampr.ab.ca

Comments, criticisms, suggestions or questions about the group can be e-mailed to:
rec-radio-request@ve6mgs.ampr.ab.ca

But before you do so, please be sure to check out the "Submission Guidelines" article.

The influence of the moderator should be minimal and of an administrative nature, consisting chiefly of weeding out obviously inappropriate articles, while making sure correct headers etc. are used for the appropriate ones.

-- What type of material is considered inappropriate?

There are three broad categories of articles which will be rejected by the moderator:

1) Requests for information: rec.radio.info is strictly a one-way street. I receive information in my mailbox; I then post it to rec.radio.info. Requests for specific information belong in the normal discussion newsgroups. If your request gets answered, you might consider passing the answer on to rec.radio.info, though. Especially if you can edit it into a informational, rather than a discussion, format.

2) Obvious discussion articles, or articles that appear unsubstantiated.

3) Commercial stuff: a relatively unbiased test of a radio product would be accepted, but any hint of for-profit might be reason for rejection. For three reasons: This is not the purpose of the list, for-profit is a controversial topic, and this list may be passed onto Amateur Packet Radio (where for-profit is prohibited except under certain provisos).

rec.radio.swap (or possibly comp.newprod) may be more deserving of the posting in any matter.

Similarly, copyrighted material generally cannot be used. If it's TRULY worthwhile to the net, I would recommend obtaining permission from the copyright holder. Please note the source, and if permission was given. I

reserve the right to make the final decision concerning appropriateness in all situations. In most cases, a brief summary of, or pointer to, the copyrighted information may be all I can allow.

-- I do not have access to news, how can I get the information posted to rec.radio.info?

brian@UCSD.EDU (Brian Kantor) has kindly supplied a mail list server for rec.radio.info. Non of the articles will be digested, due to their size, so you will receive individual mailings for every article posted to the group.

Mail sent to radio-info@ucsd.edu will be forwarded to the moderator and thus is an alias to rec-radio-info@ve6mgs.ampr.ab.ca

To subscribe and unsubscribe via the listserver; the format for that is

sub address radio-info
unsub address radio-info

where 'address' is your full mailing address. Send this request to

listserv@ucsd.edu

Note that the server will automatically delete any address that bounces mail. If you leave the address portion blank, it will try to deduce your address from the mail headers. This may not work if you are on bitnet, milnet or some other non-Unix host, so it is recommended to put your return address in any case. For example:

sub mymailbox@myhost.mydomain.mil radio-info
or
sub MEMEME01@DMBHST.bitnet radio-info

or something like that.

-- Will the material appearing in rec.radio.info be archived somewhere?

Yes. Still firming up details at the moment but here is a preliminary list:
- unbc.edu as maintained by Lyndon Nerenberg <lyndon@unbc.edu>
- nic.funet.fi maintained by Risto Kotalampi <rko@cs.tut.fi>
saved to /pub/dx/text/rec.radio.info currently stored as numbered files.

Effectively this means that anything you post to rec.radio.info will be permanently stored, so your work will not be lost.

-- I have a regular posting with timely information, is there a way to speed up it's delivery, or automate for more convenience?

Yes, there is! It may take a bit of chatter with the moderator, but we are willing to take responsible people and provide them the means of posting the articles directly from their site. We will try everything we can as we fully realize that DX (distant signal) and astronomical data can be somewhat transitory. We are also willing to allow regular posters of information the same courtesy, even if the information is not as time critical.

We refer to this as self-moderation, which is partly based on the model for news.answer. This requires co-operation and good will to be beneficial to the community in the rec.radio hierarchy.

I suggest reading the posting guidelines for more information. I am open to suggestions.

I thank the following individuals for their input into this article:
rec.music.info moderator Leo Breebaart rec-music-info@cp.tn.tudelft.nl
rec.radio.broadcasting moderator Bill Pfeiffer wdp@gagme.chi.il.us
Paul W. Schleck, KD3FU pschleck@unomaha.edu

329. KISS mode problems with Tiny 2 (Solution)

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-01-31 11:45:00 UTC
From: oopdavid@ubvms.cc.buffalo.edu
Message-ID: <CKHsox.EK2@acsu.buffalo.edu>
Source record: 50321

KISS will not work properly with the Tiny 2 unit if you are using an older PROM. The latest release version, around April 1993 is just fine. There is no other way out if you have the older code. Call PacComm and order the latest PROM. Be sure to specify whether you have a standard Tiny 2 or a Mark II. Dave KN2M.

330. Firmware upgrade for TAPR TNC

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-01-31 11:56:04 UTC

I know people have talked about this before, but i was wondering is
there anyway i can run my baycom modem with windows3.1 ?????

I have tried so many different combinations of software, that it is
driving me mad!!! I have looked into BPQ, with the BPQax25 driver,
TPK, with the tpkax25 driver, and the usual tfpcx and tfpcr but
had no luck.

I am sure some one out there must of got it to work, or if not, some
programmer that has got lots of time free and wants to write a driver.

I look forward to hearing from you,

OFFICE MEMO Digital Conference Date:1/31/94

1994 ARRL NATIONAL CONFERENCE ON DIGITAL COMMUNICATIONS

MINNEAPOLIS, JANUARY 12 -- The TwinsLAN ARC today announced that it will sponsor the 1994 ARRL National Digital Communications Conference on August 19 through 21 at the Thunderbird Hotel and Conference Center in Bloomington, Minnesota, U.S.A.

The objective of the conference is to create a forum for radio amateurs and experts in digital communications to meet, publish their work and present new ideas and techniques for discussion. Presenters and attendees will have the opportunity to exchange ideas and learn about recent hardware and software advances, theories, experimental results, and practical applications. Areas of interest include generation, coding, modulation and demodulation, transmission, networking, processing, presentation and application of voice, text, image and data information.

The conference site is located near the Minneapolis/St. Paul International Airport, just off Interstate I-494. Free 24-hr shuttle service is available to and from the airport.

AGENDA:
The agenda for the three-day event includes informal activities for attendees and family members on Friday, August 19 through noon Sunday, August 21. Formal conference activities, including presentation of papers and six forums are scheduled for Saturday, August 20, from 8:30 am to 5 pm. A detailed agenda will be available when schedules are finalized.

CALL FOR PAPERS:
Anyone interested in digital communications is invited to submit a paper for publication in the conference Proceedings. Presentation at the conference is not required for publication. Papers are due by June 20 and should be submitted to Maty Weinberg, ARRL, 225 Main St., Newington, CT 06111, U.S.A., or via Internet at lweinber@arrl.org.

A challenge is to get the "doers and thinkers" to set aside their soldering irons or turn away from their code long enough to document their work. In this regard, if there is a

topic you think should be included in the Conference, or someone that should be encouraged to publish and/or present their accomplishment, please contact Rick Whiting, W0TN, by Internet e-mail (preferred) to rick_whiting@atk.com, or by MCI Mail, CompuServe 71445,377, or U.S. Mail to 5780 Rosewood Lane N., Plymouth, MN 55442, U.S.A.

ACCOMMODATIONS:
On-site accommodations are available at a special rate of $67 (plus tax) for single occupancy or $73 (plus tax) for double occupancy. Make reservations directly with the Thunderbird Hotel at 800-328-1931 before July 29 for these special rates. Be sure to mention you are attending the National Digital Communications Conference. Off-site accommodations are available in the area starting at $39.95. Contact the NDCC Info Line for a list of facilities. Early reservations are encouraged. A list of area campgrounds for RVs is also available. Northwest Airlines is offering an additional 5% discount on airfare to and from the Twin Cities for conference attendees. Call the NDCC Info Line for details.

A FAMILY WEEKEND:
Family participation in the NDCC is encouraged. The hotel has a large pool for guests. Informal outings are planned to the Minnesota Zoo (admission extra) and the Mall of America, the largest indoor shopping mall in the US. Free scheduled shuttle service is also available from the conference center to the Mall. Minnesota is a great place to visit in August. Consider making this weekend an addition to your family vacation plans. Twin Cities and Minnesota tourist information packets are available on request to the NDCC Info Line.

REGISTRATION:
The conference registration fee is $45 per person, which includes a luncheon buffet, a set of conference papers (including those submitted but not presented) and transportation to the Mall of America on Saturday evening. Registration, by check payable to "TwinsLAN Conference", must be received by August 12. Mail your registration form and check to:

1994 National Digital Communications Conference
c/o Paul Ramey WG0G
16266 Finland Ave.
Rosemount, MN 55068

OFFICE MEMO Source For Info re Ham Radio Date:1/31/94
The following is in answer to Steve Ling's request for info on ham radio...

A good place to start is the American Radio Relay League (ARRL) Information Service. This is a mail server that let's you access many information files containing information about various facets of Amateur Radio. You can retrieve these files selectively by sending an e-mail message to ARRL HQ (address to info@arrl.org). Each file you request is e-mailed back to you automatically, usually within a few hours. To start I recommend you send the following as the text of the message:

send help
send index
send prospect
quit

This will get you all the information you need to use the infor server to get the answer to your question.

>Is it some sort of packet program?

KA9Q is the callsign of Phil Karns, who developed the
seminal TCP/IP suite for use over amateur radio.

THere are many variants now, but they all basically
provide TCP/IP connectivity for ham radio.

What is TCP/IP? It is a protocol and set of
utilities for networking, mail, real-time chat, file tansfer,
and other connectivity "stuff".

Any specific questions?

340. TCP bridge software on 386 box with "Rangelan ISA" cards.

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-02-01 02:52:02 UTC
From: jdb@arp.anu.edu.au
Message-ID: <2ikg4i$dbr@manuel.anu.edu.au>
Source record: 50329

Hi - a newbie question.

I want advise on the best setup using "cheap" hardware for TCP/IP over radiowaves, preferably for 5 to 10 miles line-of-site.

I currently have some 80386 computers with the "RangeLan ISA" cards and ethernet cards in them. I plan to use these as bridges/routers/repeaters (whatever works best) between geographically seperate ethernets. Specifically one at my house and one at my work.

I would like advise on what software to use (JNOS, KA9Q, etc), what version of this software, advise on whether I should upgrade to 486 processors (I am currently using the 242 Kbps Rangelan cards, but might use the 2Mbps cards), advise on aerials (although I think I have about the best price vs. performance with a Yagi), advise on how well other people succeeded with this sort of setup, advise on distance vs. reliability, the affect of weather on comms, the maximum throughput anybody has got, and any general advise that you think of.

you can email to me and I will summarise.

Details on the RangeLan cards I have:
========== don't read any further unless you are bored ==============

General:
========
bus interface: ISA bus (PC/XT or PC/AT)
maximum range: 500 feet (assumes no directional aerial !)
data rate: 242 Kbps

Network:
========
Driver support: NetWare 2.X, LANtastic, NetBIOS, NetWare Lite,
NetWare 3.11, NDIS
Media Access Protocol: RangeLAN CSMA/CA
Error detection/correction: spread spectrum coding/decoding,
hardware CRC-16 and firmware
Logical Link Control (LLC)
Security: hardware scrambling, software controlled security code

Radio:
======
Radio type: spread spectrum
Frequency band: 902 to 928 Meghertz
Independant Channels: 3

Physical:
=========
Width: 3.9 inches
Length: 9.2 inches

Regulatory Approval:
====================
FCC: Class B

Compatability Notes:
====================
NetWare: 2.X, 3.11, Lite
NetBIOS: full support
LANtastic: requires copy of LANtastic AI at each node
[JDB: note, I am note sure about the letters "AI",
I am working off a photocopy of a fax :-( ]
LAN Manager: NDIS driver

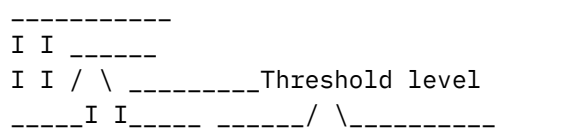
>aadamson@symantec.com

Well i have just had a lecture on data transmissions, so i should be able
to answer your question.

If we take a simple digital system, then we have a finite number of wave forms,
0 and 1. Now if we send a signal, lets just say a pulse down a transmission
line, which can be anything from a bit of cable, optical fibre, or by radio
waves, after the signal has travelled along the line, the signal
becomes distorted. If we want to send the signal over a large distance,
then by the time it reaches the Rx it will be nothing more than noise.

To get around this problem, regenerative repeaters are placed in the line
at set intervals. The idea of these repeaters is to take the distorted
waveform, (ie. the slightly curved pulse) and output a purely digital pulse
with only 0's and 1's. The process works by setting a threshold voltage, and
any voltage below this is classed as a '0' and anything about is a '1'. If
we have a digital signal of 5 volts, then the threshold voltage might
be 2.5volts.



Input signal to line Input signal to regenerative repeater

The trick with these repeaters is to place them as far apart as possible
along the line, but not to far apart that errors occur.

I hope this makes sence, and is correct as otherwise i am going to fail
my exams!!

342. Hamblaster update

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-02-01 13:06:16 UTC
From: jwa@tellabs.com
Message-ID: <1994Feb1.130616.12652@tellab5.tellabs.com>
Source record: 50334

The Hamblaster Update

Over the past several months I posted updates about a
DSP "The Hamblaster" that Will Torgrim (N9PEA) and myself
are developing.

We are focusing our efforts on a packet modem that allows
the user to improve H.F. reception by interfacing the Ham-
blaster (a PC compatable DSP sound board) to a transceiver
and a packet or all mode TNC. Modems/filters for RTTY,
Packtor, Amtor are also under developement and are compatable
with the same control panal software.

Here are the latest developements
1-31-94

1) The Hamblaster can play ".wav" files
at sample rates less than 15 kHz.

2) Adaptive (LMS) filter

There's ongoing developement in this area. We are
planing (I don't think this has been done before)
to add controls to the LMS algorithm.

3) Fast autotune
We have a fast autotune routine that locks a packet
modem to the received signal in few milliseconds.
Tuning is a big problem on H.F. packet. Some stations
are off frequency so bad, the tnc can't receive the packets.
The auto tone (or AFC) locks the DSP modem to the FSK
center frequency.

1-3-94

3) We now have FFT analysis software built into the o-scope control
panel. When you click on the "Freq" button the audio spectrum is
displayed. You can move the mouse cursor over the display and
where ever it is positioned, the frequency is displayed in the
status window. When you click the mouse the modem filters jump
to the frequency. This feature provides a simple tuning aid.

Another button allows you to convert all 4 traces (mentioned in
paragraph 3) to spectral displays. You can, for example, analyze
the frequency at the input signal, the modem prefilter and the
mark filter output. Based on the FFT, a second button allows
you to modify the filter tune limits by clicking on min-max

limits that you select.

I have to admit, After I debugged the FFT software and got the control panel working to my satifaction, I got hooked on the operation of the Hamblaster system. I spent hours tuning the 40 and 20 meter bands, displaying the FFT and copying CW/RTTY signals through the Hamblaster filters. The FFT really simplifies the tuning process.

>packet, I would be grateful.

I think the DR-1200 makes a dandy 2m rig for packet, 1200 or 9600. Several folks in my club have 'em (me too) as well as we're using a DR-1200 for the club mailbox station. Good radio!

Yes, the DR-1200T (note the T) does need a mod to do 9600-bps packet. Alinco also sells a DR-1200H (note the H -- I believe it's an H) that comes 9600-bps ready out of the box -- no mods needed. If you intend to do voice with the DR-1200T I've been told *NOT* to do the mod.

If you need the mod it's on the net along with most other mods. If you want, just send me a piece of email and I'll send you the mod file from my QSZ! CD-ROM. (BTW, a new version of the QRZ! disk came out about 3-weeks ago with a new Windows interface and more files and updated callsign database (Canada & US combined)).

Good luck on high speed packet! I'm working to get a high-speed TNC/modem real-soon-now myself.

Are you perchance refering to Digipeater use. This is a system whereby you can
use another packet system as a repeater. It is quite handy to extend the range
to which you can communicate. My system (baycom) works as an excellent digi-
peater. Basically I place a call to my final QSO by using any reasonable number
of friends packet units. They recieve my call and pass it on to another
repeater who passes it on..... well you know, till it gets to the final
repeater.

349. packet software question from new packet user

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-02-01 23:39:12 UTC
From: dale@sequent.com
Message-ID: <1994Feb1.233912.9958@sequent.com>
Source record: 50142

Hope this is the correct newsgroup for a packet question. I've got an old MFJ 1278 TNC. This has one of their early firmware releases and suspect I'll have to stick with that. I installed a firmware upgrade and was unable to get it to talk to my terminal -- never would lock at correct baud rate. So I'm back to original firmware.

So I've had this TNC sitting around for about 3 years. I finally hooked it up to an HT this weekend and I'm on the air with packet! I'm using this with a Toshiba T1000SE which is a 640 K machine and small CPU, probably an 8086. I'm using procomm to talk to TNC. First question is about software? What is a good program to let me control the MFJ 1278 and do something like split screen when talking to someone?

I do have a 486 PC in the shack, so is there more sophisticated software that I can run to do things like control multiple streams? I was connected to a BBS last night and saw a couple connect requests from other users but could not figure out how to talk to them. This morning someone on local UHF box told me that it was hard to switch streams without software package. He uses "pkgold" I believe, but told me that only runs with PK232. So software suggestions would be appreciated.

Thanks & 73, Dale.

Hi,
a local group is looking at establishing a packet network in this
area running at 9600 or 19,200. they would like to know which radios will
work at these speeds with out (many) modifications. thoughts on tnc
selection would be welcome. operation can be in 220 or 440 or 145Mhz.

thanks

kenny

Expansion board for the Texas Instruments DSP Starter's Kit

Playing with the TI DSK is fun, but once my DSP application worked i
found it boring to do the download every time i switched it on. I just
wanted to use the DSK as a stand-alone device, so a boot EPROM was
needed.

Fortunately i know a hardware designer and asked him for advice.
He said: "No problem with fast chips. Would you like a prototype?"
A week later i got it and it works great.

Now what about some indicators?
A few days later he had added an output port with some LEDs attached.
What about some external RAM for just another FIR filter?
...and i got 8K words of zero-wait RAM!

A board like this would be useful for other DSK owners and it's no
problem to make a PCB, but first i have to find out if there is enough
interest and what should be on it.

Boot EPROM?

EPROM/RAM in program/data space?

Parallel I/O ports?

Serial I/O chip with RS-232 socket?

Anything else?

If you have a DSK and are interested in an expansion board please send
e-mail to the address below:

This report converted from a Word file to ASCII by W0TN to facilitate electronic transmission, thus destroying bold characters, underlines, many indents, etc.. So blame me, not the Committee, for the layout!

Draft #5
INTERIM REPORT
of the ad hoc
219 MHz COMMITTEE

Introduction

This ad hoc Committee was created by direction of the Executive Committee of the ARRL Board at its October 30, 1993 meeting in Memphis, TN. The Committee is composed of four members selected from the ARRL Spectrum Committee, and a Chairman selected from the ARRL Directors. Two members of the ARRL staff were assigned as support .The members of the Committee are:

J. Gordon Beattie, Jr., N2DSY
Tod Olson, K0TO Chairman
James Fortney, K6IYK
Paul Rinaldo, W4RI
Joel Kandel, KI4T
Jon Bloom, KE3Z
David Prestel, W8AJR

This committee was asked to prepare an action plan for initiating Amateur activity on the 219-220 MHz band discussed in the FCC Notice of Proposed Rule Making (ET Docket 93-40/RM-7747), issued by the FCC March 22, 1993. The comment period for the Docket ended July 15, 1993 and the expectation is that the FCC will issue a Report and Order sometime after March 1994.

During the period November 15, 1993 through January 6, 1994, Committee members exchanged preliminary information via mail, FAX, MCI and telephone. On January 8 and 9, 1994, the Committee held an in-person meeting in Cleveland, OH This interim report is based upon the ideas developed during that period.

Committee members were encouraged to discuss this topic with anyone they felt might contribute useful information. No attempt was made to restrict the flow of information to the Amateur community before or after the Cleveland meeting since it was the sense of the Committee that disclosure of such information would

be not only useful, but essential to drafting a final recommendation.

The interim report following is divided into two parts; a background section which summarizes information and a plan for utilization of the band.

The background section summarizes the things requested in the ARRL petition for access to this band, the list of requirements for Amateurs as outlined by the FCC in their NPRM; the key expectations of the FCC and WaterCom (an AMTS user) for Amateur use of the band and the expectations for utilization of this frequency band from an Amateur point of view.

The plan for utilization of the band includes specific ARRL actions and proposals for a band plan and a coordination procedure.

Background

The committee reviewed the original ARRL petition for access to the band, RM-7747, the FCC Notice of Proposed Rule Making(NPRM) Docket ET-93-40, the NewsRelease from the FCC at the time the NPRM was issued and comments to the NPRM made by other Amateur groups. The information developed by the Committee from these sources is summarized in the section following. The information is organized into that requested in the ARRL petition to the FCC, the specific Amateur requirements outlined in the NPRM, the expectations for Amateur use of the band as drawn from the NewsRelease and the NPRM, expectations of the primary AMTS organization, WaterCom; and Amateur expectations drawn from the petition, comments and Committee conversations.
The ARRL petition for additional 1.25 meter frequencies

On June 4, 1991, the ARRL petitioned the FCC for an Amateur service frequency allocation in the 216-220 MHz band. The basis for that petition was the loss of the 220-222 MHz segment by FCC action; which action had blocked evolving Amateur activity that was moving toward creating high-speed inter-city digital links. It had been a part of Amateur plans and expectations that the 220-222 MHz links would be interconnected to achieve a high-speed nationwide communications system funded and maintained by Amateurs. This network would serve Amateur interests in its daily operation, but its emergency preparedness and national defense capabilities would be available when required.

In its petition for spectrum in the 216-220 MHz band the ARRL noted that Amateur use of that band would be on a secondary, non-interference basis and specifically for coordinated, high-speed digital point-to-point communication. For Amateurs to do

this successfully, it will require not only the frequency coordination between Amateurs which is now a part of Amateur VHF-UHF operations, but will require coordination of frequency and direction of transmission with respect to existing, and future, Primary Users .

Further, the ARRL felt it would not be advisable for Amateurs to be able to access the band without prior coordination by a spectrum manager (and)/or database administrator to assure that chances for interference to a Primary User of the band were minimized. The ARRL offered its services in this role and stated its willingness to provide advice to Amateurs wishing to initiate operation in the band as well as providing notice to Amateur users of the band when new, non-Amateur users initiated operation.

The ARRL proposed the following changes to the Part 97 rules :

Auxiliary station operation be permitted only in the 216-220 MHz, 431-433 MHz and 435-438 MHz band segments.

In the 1.25 m band, the segment 216-220 MHz be used only for point-to-point Amateur fixed operation, and

1. No Amateur station shall cause interference to maritime mobile, fixed stations or other mobile licenses operating in the band.

2. Prior to commencement of operation in the band , Amateur stations are cautioned to contact a database administrator for frequency recommendations.

3. The licensee of the Amateur station must make all necessary adjustments (including termination of transmission) if harmful interference is caused.

Transmitter power be limit to 25 watts PEP when the control operator is a Novice Class licensee and 50 watts PEP for higher license classes.

Amateur requirements for operation as specified in the FCC NPRM

Amateurs will be required to operate on a secondary basis in the frequency band of 219-220 MHz

Operation will be Amateur auxiliary stations or as other Amateur fixed point-to-point operations.

Maximum symbol rate of 56 Kilo Baud for codes specified in part 97.309(a) and a maximum of 100 KHz bandwidth for codes not specified in 97.309(a)

Prior to initiation of operation, Amateurs within 50 miles of an AMTS station will be required to obtain written approval

from the AMTS allowing them to operate.

Prior to initiation of operation, Amateurs further than 50 miles but within 150 miles of an AMTS station must provide official notification of intention to begin operation at least 14 days prior to the start.

Amateurs must operate in a fashion that does not interfere with US. Navy SPASUR no matter where the Amateur station is located.
FCC expectations for Amateur operation in this band.
Effective utilization of this band by Amateurs is anticipated to require technological innovation on the part of the Amateurs. New technology as it arrives may provide cause to consider amendment to the rules.
WaterCom (and other AMTS licensees) are expected to develop procedures to effectively exchange data about their operations with Amateurs so that their operations may be adjusted to avoid interference to the AMTS.
Frequencies will be used for inter-city wide band digital communication links.
To avoid interference to Primary Users (and to each other), Amateur links will utilize highly directional antennas, will employ operational flexibility, and will be coordinated. As has been the case to this point, the FCC does not expect to mandate frequency coordination, but instead expects Amateurs to cooperate and coordinate on their own.
WaterCom expectations for Amateur secondary use of this band.
Amateurs are expected to perform the necessary "engineering" to assure non-interference prior to initiating operation in the band.
A single point of contact will exist for WaterCom to communicate interference notices and information about WaterCom operations.
Amateur expectations for utilization of this band.
This band is probably the only band in which a terrestrial nationwide network is feasible. Two meter regulations do not permit wide band, high data rate transmissions, and 70 cm does not have as favorable propagation characteristics.
The 219-220 MHz meter band has good mid-range propagation, has relatively little adjacent channel use, and there is no existing use by Amateurs. For these reasons, we can structure its use from the outset toward high speed digital point to point links which can be assembled into a nationwide network.
At this point equipment for high speed digital links is not readily available to Amateurs. Some 56 Kilobit half-duplex modems are in use, but there are very few in operation at present. Some 19.2 Kilobit links on UHF are in place. Overall, equipment and other technology which would support data rates greater than 150 Kilobits/sec running full duplex remain to be developed for Amateur links. Achieving these high rates in

a nationwide network would position amateurs to be able to send "snippets" of voice, audio and video as well as the person to person text messages, DX spotting information and data files that are common today.

Proposed Plan for 219 MHz

It is recommended that this band be used to establish a high speed nationwide digital data network by linking inter-city point-to-point Amateur stations. The Committee estimates that 700-800 individual links will be required to achieve a true, nationwide network and may take five to ten years to reach that stage.

Use

A proposal for a 219-220 MHz Band Plan has been prepared and is attached as Appendix A .

It is expected that in populated areas, to compensate for the loss of 220-222 MHz, there may be a desire to utilize the 219-220 MHz band immediately with whatever technology may be at hand. We believe this would be self-defeating. Strong encouragement on the part of Local Coordinating Bodies(LCB), the ARRL, and other groups of Amateurs to carefully coordinate the use of this band will pay big dividends. An effective, high-speed network will make handling of packet messages via local bulletin board and messaging systems more productive. An end result will be to reduce pressure on some of the 2 meter links now in use as a message network.

Since it is very difficult to "adjust" the use of a band or portion of a band after use has begun, we recommend that a technical threshold be established for individual links, assuring the success of a high speed nationwide network. At this point, it means that no point-to-point links of 1200, 2400, 9600 or even 19,200 baud should be created.

Point-to-point transmissions on this band should be a contiguous stream of bits with header frames for routing. The equipment associated with the transmission between links should not be required to be cognizant of any special attribute or content of the bits being transmitted. Data from all sources should be handled in a uniform manner, impartial as to source and content.

Technology and protocol should be developed to manage data buffering to smoothly transition from the high-speed link to lower speed network nodes with eventual delivery of data to the individual Amateur.
Coordination

A proposed procedure for use by Local Coordinating Bodies is in Appendix B attached.

Coordination of stations that use this band is imperative. We will be a Secondary User. Our use will be dependent upon successfully engineering link installations to avoid interference to the Primary Users. More than that, coordination offers the best opportunity to effect orderly and efficient entry into the band in a way that enables Amateurs to link stations into a high-speed digital network.

Having learned from the problems of growth of digital communications in heavily populated VHF bands, this untouched band affords an opportunity to employ our hard won knowledge as we plan our links.

Role of the ARRL

Administrative support

The ARRL should develop and maintain a database of current assignments to other services in this band. This information may include information about users adjacent to the band as well as those operating directly in the band.

The ARRL should develop a database of amateur links established in the band. This list will aid the coordination process for amateurs and provide a database for reference in the event of interference complaints.

The ARRL should establish an operating relationship with WaterCom and other AMTS users so that a single point of contact to handle interference complaints can be created. Also, through this relationship, a database of AMTS users can be acquired to assist in the designing and coordination of Amateur links.

The ARRL should prepare and distribute upon request, a procedure for engineering a link installation including handling the required AMTS approval or notification.
Technical support

The ARRL should develop worksheets to assist Amateurs in planning, engineering, and coordinating their links. A model will be required to investigate the interference potential of Amateur operation in a particular location. Power, antenna orientation, terrain and location of AMTS or other Primary Users will affect the outcome.

The ARRL should assign staff and/or sponsor studies which will clarify the technical requirements for RF propagation performance and the technical requirements for modulation/bandwidth performance. The band plan in Appendix A and the Coordination Procedure outlined in Appendix B are

predicated on several technical assumptions which require validation.

The ARRL should spearhead the Identification of manufacturers of Amateur and/or commercial equipment which can meet the high performance requirements of this network. These manufacturers should be encouraged to develop systems and components which can be used by Amateurs to create the high speed links.

The ARRL should stimulate and support the definition of new protocols for use in the high-speed network. This appears to be an appropriate task for the ARRL Future Systems Committee. Standards of all types will have to be defined and agreed to by members of the Amateur community. We need to be able to smoothly couple the existing BBS systems and links to the inter-city links. The ARRL Digital Committee should be asked to contribute to this effort.

A network topology will need to be created which will support the integration of diverse existing local networks. It is not clear at this time just how this can be effectively supported by the ARRL. We will comment further in our final report.

Information Support

The task of assembling a nationwide network from a series of individually engineered and owned building blocks will require a great amount of information interchange.

The ARRL should establish a newsletter directed toward information exchange with respect to equipment, software, coordination activity, protocols, network topology, etc. The emphasis here is not "professional product" but current information that can help others. The newsletter actually need not be published in the classic sense. We are able to utilize existing modes of dissemination, e.g. Internet, HIRAM, MCI, CompuServe, etc. The critical component is an information "gatekeeper" and/or editor assigned to receive, organize and perhaps index the information.

The ARRL should provide copies of this interim report to existing coordinating groups, appropriate equipment manufacturers and other interested parties making inquiry. Copies of this report and such other information as may be available at that time should be offered at the ARRL Booth at the Dayton Hamvention next April.

The ARRL should provide a session at the Digital Symposium this year devoted to discussion of the proposed nationwide network.

Extension of 219 Committee Assignment

The 219 Committee is an ad hoc Committee which will dissolve after it has prepared a plan for utilization of the 219-220 MHz and presented it for consideration by the ARRL Board. Under our current charter, we expect to issue a final report approximately 45 days after an FCC Report and Order creating the band.

This interim report recommends that the ARRL encourage and support the creation of point-to-point high-speed digital links in this band in a form which permits them to be linked into a network.

The multiplicity of tasks which are a part of providing the ARRL support and leadership in the establishment of the network, suggests some sort of "Project Management" would be beneficial. Monitoring the various ARRL support activities will help assure that everything is "fitting" together. When the time comes that adjustments to the current plan must be made, the existence of a monitoring group can facilitate those adjustments.

We suggest that the Board authorize the existing 219 Committee to assume the role of "Project Manager", and to perform that function for at least one year following establishment of the 219-220 MHz band.

APPENDIX A

219-220 MHz Band Plan

Local Coordinating Bodies should coordinate this band such that ten 100-KHz Primary channels are created centered on the following frequencies:

Channel A 219.050
Channel F 219.550
Channel B 219.150
Channel G 219.650
Channel C 219.250
Channel H 219.750
Channel D 219.350
Channel I 219.850
Channel E 219.450
Channel J 219.950

Use of two of these channels in combination to achieve a full duplex environment is desirable.

Since the use of the band is for point-to -point fixed operation with a maximum of 50 watts PEP, and non-interference with Primary Users of the band is mandatory, highly directional antennas with horizontal polarization are recommended.

Because the plan for this band is use for inter-city links which can be assembled into a nationwide high-speed digital network, allocation of channels to point-to-point pairs running less than 56 Kilobits duplex

should be discouraged. No matter what the bandwidth of the transmissions coordinated into a channel, they should be centered in the channel. The long term objective for digital transmission on these channels is 100 KHz bandwidth. Local Coordinating Bodies should seek to avoid decisions which will limit the nationwide network.

APPENDIX B

****
The drafting of this document was incomplete at the time of submittal. One of our members was located in the California Earthquake area and we were unable to communicate with him to achieve consensus on this part. The material below should be considered indicative of the Committee thinking, but should not be viewed as Committee consensus. We will complete this section and distribute it as quickly as possible after January 22, 1994.

****

PROPOSED PROCEDURE
FOR COORDINATION OF AMATEUR RADIO
OPERATION ON THE 219-220 MHz BAND

I. PURPOSE

To define the process and procedure for obtaining coordination of an Amateur Radio point-to-point relay link in the 219-220 MHz band.

II. GENERAL

A. The Amateur Radio Service is authorized to operate wide band point-to-point digital relay links in the 219-220 MHz Band on a secondary basis. Regulations require notice and coordination in order to ensure that Amateur Radio operations do not interfere with Primary Licensees.

B. The ultimate responsibility for complying with the registration, notification, and non-interference provisions of the Regulations lies with the individual Amateur Radio Operator. This procedure is designed to assist the Amateur in complying with those Regulations, and to facilitate the orderly and efficient coordination of those Amateurs that wish to utilize the Band.

C. The 219-220 MHz allocation offers a unique opportunity for implementation of full-duplex wide band digital circuits at a frequency where longer distance propagation is possible. Therefore, it is recommended that the Band usage be limited to such a service, and that implementations which inefficiently use he recommended 100 KHz bandwidth be avoided.

D. The Amateur Radio Service has recognized Spectrum Management and Repeater Coordination Organizations which function in a large portion of the Country. This procedure envisions that these organizations and the American Radio Relay League (ARRL) will,

where appropriate, assist the individual Amateur in complying with the Regulations and good usage practices.

E. The ARRL volunteered to establish and maintain a data base which contains information on all known Primary Licensees and their Systems. This data base includes information on operations located adjacent to the Band. WaterCom, a major AMTS Licensee, has entered into an agreement with the ARRL to assist in this process. The ARRL will also maintain a record of all authorized and coordinated Amateur Radio Stations operating in the 219-220 MHz Band.

F. Resolution of interference to Primary Licensees' is facilitated by providing contact information on coordinated 219 MHz Amateur operations from the ARRL database.

III. DEFINITIONS

For the purposes of this procedure, the following definitions apply.

A. ARRL 1.25M Data Base (ARRL 1.25M DB) - A data base that contains licensing information for non-Amateur Primary and Secondary Users in the 216-222 MHz frequency segment. It includes Amateur Users in the 219-220 MHz Band that have obtained operational coordination in accordance with this procedure.

B. ARRL Data Base Manager (ARRL DBM) - The ARRL representative responsible for maintaining the ARRL 1.25M Data Base.

C. LOCAL COORDINATING BODY (LCB) - The applicable Spectrum Management organization recognized under 47 C.F.R. Part 97.201(c). This function will normally exist in one of the following forms:

1. A spectrum management organization that has some responsibility for reviewing and authorizing 220 MHz repeater operations, and which performs band usage planning for the non-repeater activities.

2. A spectrum management organization that has some responsibility for reviewing and authorizing 220 MHz repeater operations, and which has delegated band usage planning and coordination of digital activities to a sub-unit.

3. A spectrum user (user group) who is in an area not serviced by either #1 or #2 above.

IV. PROCEDURE

A. Application for Coordination

1. The applicant network segment implementor will determine a path where use of the 219-220 MHz band might be applicable. The applicant discuss plans with the local digital planners and their LCB.

2. After identifying Latitude and Longitude information for each location, the user will submit a "Request for 219 Data" to the ARRL

DBM. This request may be forwarded through the LCB or submitted directly to League Headquarters. (Depending upon prior activity, the LCB may have the required information already in their files. Actual submittal of the request may initially be by mail, but it is envisioned that this inquiry should be available via electronic distribution in the long term.)

3. The information returned by the ARRL DBM will include data on all known operations within approximately 250 miles of the identified sites. If standardized software tools for evaluating path and site selection are available, they will be provided upon request.

4. The User is expected to apply the available models to determine if the proposed segment is practicable, and if it falls into either the class of stations that will require permission, or the ones that require notification.

a. Stations located within 50 miles of an AMTS Shore Station are required to obtain permission from the Shore Station Licensee, and

b. Stations located between 50 and 150 miles of an AMTS Shore Station are required to Notify the AMTS Licensee 15 days prior to operation.

5. Once the User determines that operation in the proposed segment without interference to another user is possible, a formal "Request for Coordination" must be submitted to the LCB. Each LCB may require slightly different information, but normally it will include:

a. Administrative data related to the applicant,
b. System data to illustrate how this segment will be integrated into the network,
c. Engineering data for path propagation, and
d. Engineering data documenting non-interference w/other services.

6. The LCB will act on the request based upon regular locally developed procedures. This action will be one of the following:

a. If acceptable and no notice provisions apply, issue a "Notice of Test Coordination" in accordance with local policy.

b. If acceptable and Notice is required, issue a "Notice of Test Coordination" and inform the. User that they are to mail a copy of the "Notice of Proposed Operation" to all impacted Licensees by Certified Mail.

(1) A "Notice of Proposed Operation" must include instructions for Licensee to copy LCB on any correspondence that may be sent on the matter.

(2) The User is responsible for supplying LCB with copies of mailing Certification Form(s).

c. If acceptable, and AMTS Licensee Permission is required, notify the User of acceptable application and instruct him to apply for permission to test from AMTS Licensee. Upon receipt of written acceptance from AMTS Licensee, issue "Notice of Test Coordination".

(1) Request for permission to test must include instructions for Licensee to copy LCB on any correspondence that may be sent on the matter.

(2) User is responsible for supplying LCB with copies of all documentation.

d. If acceptable but another Amateur circuit may be in position to be impacted, issue a "Notice of Test Coordination" and provide co-/ adjacent channel notification.

e. If acceptable and multiple notification procedures apply, comply with each as per above.

f. If unacceptable, deny the request.

7. The LCB will forward a copy of all "Notices of Test Coordination" to the ARRL DBM.

8. Upon satisfactory completion of the Test Coordination Period, the LCB issues User a "Notice of Coordination" and forwards a copy to the ARRL DBM.

a. Operations requiring the permission of an AMTS Licensee shall require that the User obtain a final written permission before the LCB will issue a "Notice of Coordination".

9. The ARRL DBM will include a "Notice of Test Coordination" data in the ARRL 219 DB for as long as the test coordination is in effect, and will cause the "Notice of Coordination" data to be added permanently.

[B. De coordination as a Result of Primary Licensee Changes]

To be determined.

C. Primary User Problem Resolution

A phone, fax or written problem notification may be made by the Primary spectrum user to the Coordinated Amateur, the LCB, and the ARRL. The ARRL will register all correspondence related to the complaint, and assist as appropriate, in the resolution process.

Amateur users will need to recognize that when the primary user is no longer satisfied with sharing the spectrum, that the Amateur operation may need to cease. This can be constrained through an agreement with the FCC and/or primary spectrum users detailing technical standards.

Alternative Proposal for Section IV

IV. Procedure

A. Application for Coordination

1. The prospective applicant requests procedural information including engineering software and database from the LCB.

2. The applicant performs latitude, longitude, and engineering analysis, with the assistance of the LCB if necessary, and submits the results on a form to the LCB.

3. The LCB reviews the application, including the proposed location, propagation and radiation pattern engineering, equipment, frequency selection, and primary and amateur co-channel user database, and notifies the applicant of the results.

If there is judged to be no potential interference to existing primary (AMTS) and co-channel amateur users, but the applicant is within 50 or 150 miles of a primary user, the LCB issues a notification of provisional coordination pending notification and/or permission request to the primary user by the applicant, and a successful on-the-air non-interference test.

If the LCB does not receive a copy of the notification and/or permission request from the applicant within 60 days, the provisional coordination is declared null and void by the LCB with a written notice to the applicant.

If the applicant is not within 50 or 150 miles of a primary user or existing amateur co-channel user, the LCB issues a Notice of Provisional Coordination pending an on-the-air non-interference test only.

If the LCB finds that there is potential interference to the primary and co-channel users based on the application information, a notice is sent by the LCB to the applicant to that effect and requesting a re-engineering study.

4. Upon receipt of the copy of the applicant's notification/permission request letter, the LCB issues the notice of provisional coordination pending the non-interference test.

5. If the non-interference test is successful, and the primary user grants permission to an applicant within 50 miles of its station, the applicant is granted a Certificate of Coordination, and notice of same is forwarded by the LCB to the ARRL DBM.

6. If the test is not successful, the LCB issues a letter instructing the applicant to re-engineer the system. If the applicant chooses not to re-engineer the system, the pending application is canceled.

355. Re: 219 Committee Report

Well, I see that the ARRL committee has now decided what specific type
of networking is best for us, and seeks to codify it into law.

The band plan, as set forth, requires nothing less than 56kb, and because
of its bandwidth and explicit 'signalling rate' restrictions, prohibits
anything above 56kb. Looks like we're going to have a 56kb network, folks.
Hope that's fast enough for you, dude.

And get a load of the administrative requirements! For the first time,
NON-Repeater operations will have to apply for a COORDINATED SANCTION before
they can go on the air. There's a bunch of beaurocratic hoopage to jump
through before operation is to be permitted; it seems to me that this is
more in keeping with a fee-for-service commercial data highway than an
experimental radio service such as hams have traditionally been.

Couple that with the latest proposal that indemnifies ham frequency
coordinating bodies from lawsuits and redress, and you've got the
thin end of the wedge for sure. How long after this gets adopted do we
wait for a proposal to allocate specific frequencies for, say, NTS Nets
on 40 meters? What difference is there between that and what is
proposed here?

Should we just let NABER handle the coordination?

We should see how this turns out in the NPRM, and be sure to comment
upon it vigorously.

In article 1142@btg.UUCP, rusty@btg.UUCP (Rusty Haddock) writes:
>Yes, the DR-1200T (note the T) does need a mod to do 9600-bps packet.
>Alinco also sells a DR-1200H (note the H -- I believe it's an H) that
>comes 9600-bps ready out of the box -- no mods needed. If you intend
>to do voice with the DR-1200T I've been told *NOT* to do the mod.

*** How about 1200-baud? Does anybody know if a modded DR1200T
can still work with 1200 baud? I have a DR1200T. I have Alinco's mod
kit. I have a new 9600-baud TNC. The only thing keeping me from
running home right this minute and tearing into the DR1200 is that I
still need to do 1200baud packet on 2M.

Let me rephrase the question: in general, can radios that have been
modified to do 9k6 work with 1200baud TNCs?

- Jerry

357. WEFAX Question

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-02-03 02:15:24 UTC
From: Kenneth.E.Harker@Dartmouth.Edu
Message-ID: <2ipmns$bve@dartvax.dartmouth.edu>
Source record: 50151

I am having some problems getting RadFax for the Macintosh to
receive WEFAX pictures with my Realistic DX440. I am hooking up the
radio from its headphone jack to the mic in on the mac using a simple
audio patch wire. The DX440 is using the Sony AN102 indoor amplified
antenna located near my dorm room window.
Now for the frustrating part. There's no real documentation with
the program. So, I set the radio to 8080kHz according to some post I
saw go by. I set it to USB, because I think I remember reading
somewhere that that's what I should do. I leave the program at all its
"factory defaults", in specific, it's set for:

Timing Drift Correction: -550samples/minute
Resolution Factor: 5 half-waves/pixel
Scans per minute: 120

And that's all the variables there are. I get nothing but
rhythmic static. I've tried everything from 2kHz above to 2kHz below,
USB, LSB, no BFO, etc... without anything that even slightly resembles
a weather fax transmission. In fact, it all looks very much like what
I got trying to use the KPC-3 and the autofax program for the PC.
What I am wondering is if there's just something I'm missing as
far as what to set at what, or if it's just that my reception is so
incredibly awful here that all I get is static because of that.
Perhaps someone who is using RadFax successfully in eastern North
America can let me in on their setting, freq, etc...? Alternatively,
I've got a uuencoded copy of a PICT I generated with the above
settings. Perhaps someone can offer to look at it and see what I'm
doing wrong?

73's and thanks in advance!

358. 219 Mhz Committee Report

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-02-03 08:14:21 UTC
From: Rick Whiting <Rick_Whiting@ATK.COM>
Message-ID: <2iqbot$dcn@network.ucsd.edu>
Source record: 50152

This report converted from a Word file to ASCII by W0TN to facilitate electronic transmission, thus destroying bold characters, underlines, many indents, etc.. So blame me, not the Committee, for the layout!

Draft #5
Part 1
INTERIM REPORT
of the ad hoc
219 MHz COMMITTEE

Introduction

This ad hoc Committee was created by direction of the Executive Committee of the ARRL Board at its October 30, 1993 meeting in Memphis, TN. The Committee is composed of four members selected from the ARRL Spectrum Committee, and a Chairman selected from the ARRL Directors. Two members of the ARRL staff were assigned as support .The members of the Committee are:

J. Gordon Beattie, Jr., N2DSY
Tod Olson, K0TO Chairman
James Fortney, K6IYK
Paul Rinaldo, W4RI
Joel Kandel, KI4T
Jon Bloom, KE3Z
David Prestel, W8AJR

This committee was asked to prepare an action plan for initiating Amateur activity on the 219-220 MHz band discussed in the FCC Notice of Proposed Rule Making (ET Docket 93-40/RM-7747), issued by the FCC March 22, 1993. The comment period for the Docket ended July 15, 1993 and the expectation is that the FCC will issue a Report and Order sometime after March 1994.

During the period November 15, 1993 through January 6, 1994, Committee members exchanged preliminary information via mail, FAX, MCI and telephone. On January 8 and 9, 1994, the Committee held an in-person meeting in Cleveland, OH This interim report is based upon the ideas developed during that period.

Committee members were encouraged to discuss this topic with anyone they felt might contribute useful information. No attempt was made to restrict the flow of information to the Amateur community before or after the Cleveland meeting since it was the sense of the Committee that disclosure of such information would

be not only useful, but essential to drafting a final recommendation.

The interim report following is divided into two parts; a background section which summarizes information and a plan for utilization of the band.

The background section summarizes the things requested in the ARRL petition for access to this band, the list of requirements for Amateurs as outlined by the FCC in their NPRM; the key expectations of the FCC and WaterCom (an AMTS user) for Amateur use of the band and the expectations for utilization of this frequency band from an Amateur point of view.

The plan for utilization of the band includes specific ARRL actions and proposals for a band plan and a coordination procedure.

Background

The committee reviewed the original ARRL petition for access to the band, RM-7747, the FCC Notice of Proposed Rule Making(NPRM) Docket ET-93-40, the NewsRelease from the FCC at the time the NPRM was issued and comments to the NPRM made by other Amateur groups. The information developed by the Committee from these sources is summarized in the section following. The information is organized into that requested in the ARRL petition to the FCC, the specific Amateur requirements outlined in the NPRM, the expectations for Amateur use of the band as drawn from the NewsRelease and the NPRM, expectations of the primary AMTS organization, WaterCom; and Amateur expectations drawn from the petition, comments and Committee conversations.
The ARRL petition for additional 1.25 meter frequencies

On June 4, 1991, the ARRL petitioned the FCC for an Amateur service frequency allocation in the 216-220 MHz band. The basis for that petition was the loss of the 220-222 MHz segment by FCC action; which action had blocked evolving Amateur activity that was moving toward creating high-speed inter-city digital links. It had been a part of Amateur plans and expectations that the 220-222 MHz links would be interconnected to achieve a high-speed nationwide communications system funded and maintained by Amateurs. This network would serve Amateur interests in its daily operation, but its emergency preparedness and national defense capabilities would be available when required.

In its petition for spectrum in the 216-220 MHz band the ARRL noted that Amateur use of that band would be on a secondary, non-interference basis and specifically for coordinated, high-speed digital point-to-point communication. For Amateurs to do

this successfully, it will require not only the frequency coordination between Amateurs which is now a part of Amateur VHF-UHF operations, but will require coordination of frequency and direction of transmission with respect to existing, and future, Primary Users .

Further, the ARRL felt it would not be advisable for Amateurs to be able to access the band without prior coordination by a spectrum manager (and)/or database administrator to assure that chances for interference to a Primary User of the band were minimized. The ARRL offered its services in this role and stated its willingness to provide advice to Amateurs wishing to initiate operation in the band as well as providing notice to Amateur users of the band when new, non-Amateur users initiated operation.

The ARRL proposed the following changes to the Part 97 rules :

Auxiliary station operation be permitted only in the 216-220 MHz, 431-433 MHz and 435-438 MHz band segments.

In the 1.25 m band, the segment 216-220 MHz be used only for point-to-point Amateur fixed operation, and

1. No Amateur station shall cause interference to maritime mobile, fixed stations or other mobile licenses operating in the band.

2. Prior to commencement of operation in the band , Amateur stations are cautioned to contact a database administrator for frequency recommendations.

3. The licensee of the Amateur station must make all necessary adjustments (including termination of transmission) if harmful interference is caused.

Transmitter power be limit to 25 watts PEP when the control operator is a Novice Class licensee and 50 watts PEP for higher license classes.

Amateur requirements for operation as specified in the FCC NPRM

Amateurs will be required to operate on a secondary basis in the frequency band of 219-220 MHz

Operation will be Amateur auxiliary stations or as other Amateur fixed point-to-point operations.

Maximum symbol rate of 56 Kilo Baud for codes specified in part 97.309(a) and a maximum of 100 KHz bandwidth for codes not specified in 97.309(a)

Prior to initiation of operation, Amateurs within 50 miles of an AMTS station will be required to obtain written approval

from the AMTS allowing them to operate.

Prior to initiation of operation, Amateurs further than 50 miles but within 150 miles of an AMTS station must provide official notification of intention to begin operation at least 14 days prior to the start.

Amateurs must operate in a fashion that does not interfere with US. Navy SPASUR no matter where the Amateur station is located.
FCC expectations for Amateur operation in this band.
Effective utilization of this band by Amateurs is anticipated to require technological innovation on the part of the Amateurs. New technology as it arrives may provide cause to consider amendment to the rules.
WaterCom (and other AMTS licensees) are expected to develop procedures to effectively exchange data about their operations with Amateurs so that their operations may be adjusted to avoid interference to the AMTS.
Frequencies will be used for inter-city wide band digital communication links.
To avoid interference to Primary Users (and to each other), Amateur links will utilize highly directional antennas, will employ operational flexibility, and will be coordinated. As has been the case to this point, the FCC does not expect to mandate frequency coordination, but instead expects Amateurs to cooperate and coordinate on their own.
WaterCom expectations for Amateur secondary use of this band.
Amateurs are expected to perform the necessary "engineering" to assure non-interference prior to initiating operation in the band.
A single point of contact will exist for WaterCom to communicate interference notices and information about WaterCom operations.
Amateur expectations for utilization of this band.
This band is probably the only band in which a terrestrial nationwide network is feasible. Two meter regulations do not permit wide band, high data rate transmissions, and 70 cm does not have as favorable propagation characteristics.
The 219-220 MHz meter band has good mid-range propagation, has relatively little adjacent channel use, and there is no existing use by Amateurs. For these reasons, we can structure its use from the outset toward high speed digital point to point links which can be assembled into a nationwide network.
At this point equipment for high speed digital links is not readily available to Amateurs. Some 56 Kilobit half-duplex modems are in use, but there are very few in operation at present. Some 19.2 Kilobit links on UHF are in place. Overall, equipment and other technology which would support data rates greater than 150 Kilobits/sec running full duplex remain to be developed for Amateur links. Achieving these high rates in

a nationwide network would position amateurs to be able to send "snippets" of voice, audio and video as well as the person to person text messages, DX spotting information and data files that are common today.

Proposed Plan for 219 MHz

It is recommended that this band be used to establish a high speed nationwide digital data network by linking inter-city point-to-point Amateur stations. The Committee estimates that 700-800 individual links will be required to achieve a true, nationwide network and may take five to ten years to reach that stage.

Use

A proposal for a 219-220 MHz Band Plan has been prepared and is attached as Appendix A .

It is expected that in populated areas, to compensate for the loss of 220-222 MHz, there may be a desire to utilize the 219-220 MHz band immediately with whatever technology may be at hand. We believe this would be self-defeating. Strong encouragement on the part of Local Coordinating Bodies(LCB), the ARRL, and other groups of Amateurs to carefully coordinate the use of this band will pay big dividends. An effective, high-speed network will make handling of packet messages via local bulletin board and messaging systems more productive. An end result will be to reduce pressure on some of the 2 meter links now in use as a message network.

Since it is very difficult to "adjust" the use of a band or portion of a band after use has begun, we recommend that a technical threshold be established for individual links, assuring the success of a high speed nationwide network. At this point, it means that no point-to-point links of 1200, 2400, 9600 or even 19,200 baud should be created.

Point-to-point transmissions on this band should be a contiguous stream of bits with header frames for routing. The equipment associated with the transmission between links should not be required to be cognizant of any special attribute or content of the bits being transmitted. Data from all sources should be handled in a uniform manner, impartial as to source and content.

Technology and protocol should be developed to manage data buffering to smoothly transition from the high-speed link to lower speed network nodes with eventual delivery of data to the individual Amateur.
Coordination

A proposed procedure for use by Local Coordinating Bodies is in Appendix B attached.

Coordination of stations that use this band is imperative. We will be a Secondary User. Our use will be dependent upon successfully engineering link installations to avoid interference to the Primary Users. More than that, coordination offers the best opportunity to effect orderly and efficient entry into the band in a way that enables Amateurs to link stations into a high-speed digital network.

Having learned from the problems of growth of digital communications in heavily populated VHF bands, this untouched band affords an opportunity to employ our hard won knowledge as we plan our links.

Role of the ARRL

Administrative support

The ARRL should develop and maintain a database of current assignments to other services in this band. This information may include information about users adjacent to the band as well as those operating directly in the band.

The ARRL should develop a database of amateur links established in the band. This list will aid the coordination process for amateurs and provide a database for reference in the event of interference complaints.

The ARRL should establish an operating relationship with WaterCom and other AMTS users so that a single point of contact to handle interference complaints can be created. Also, through this relationship, a database of AMTS users can be acquired to assist in the designing and coordination of Amateur links.

The ARRL should prepare and distribute upon request, a procedure for engineering a link installation including handling the required AMTS approval or notification.
Technical support

The ARRL should develop worksheets to assist Amateurs in planning, engineering, and coordinating their links. A model will be required to investigate the interference potential of Amateur operation in a particular location. Power, antenna orientation, terrain and location of AMTS or other Primary Users will affect the outcome.

The ARRL should assign staff and/or sponsor studies which will clarify the technical requirements for RF propagation performance and the technical requirements for modulation/bandwidth performance. The band plan in Appendix A and the Coordination Procedure outlined in Appendix B are

predicated on several technical assumptions which require validation.

The ARRL should spearhead the Identification of manufacturers of Amateur and/or commercial equipment which can meet the high performance requirements of this network. These manufacturers should be encouraged to develop systems and components which can be used by Amateurs to create the high speed links.

The ARRL should stimulate and support the definition of new protocols for use in the high-speed network. This appears to be an appropriate task for the ARRL Future Systems Committee. Standards of all types will have to be defined and agreed to by members of the Amateur community. We need to be able to smoothly couple the existing BBS systems and links to the inter-city links. The ARRL Digital Committee should be asked to contribute to this effort.

A network topology will need to be created which will support the integration of diverse existing local networks. It is not clear at this time just how this can be effectively supported by the ARRL. We will comment further in our final report.

Information Support

The task of assembling a nationwide network from a series of individually engineered and owned building blocks will require a great amount of information interchange.

The ARRL should establish a newsletter directed toward information exchange with respect to equipment, software, coordination activity, protocols, network topology, etc. The emphasis here is not "professional product" but current information that can help others. The newsletter actually need not be published in the classic sense. We are able to utilize existing modes of dissemination, e.g. Internet, HIRAM, MCI, CompuServe, etc. The critical component is an information "gatekeeper" and/or editor assigned to receive, organize and perhaps index the information.

The ARRL should provide copies of this interim report to existing coordinating groups, appropriate equipment manufacturers and other interested parties making inquiry. Copies of this report and such other information as may be available at that time should be offered at the ARRL Booth at the Dayton Hamvention next April.

The ARRL should provide a session at the Digital Symposium this year devoted to discussion of the proposed nationwide network.

Extension of 219 Committee Assignment

The 219 Committee is an ad hoc Committee which will dissolve after it has prepared a plan for utilization of the 219-220 MHz and presented it for consideration by the ARRL Board. Under our current charter, we expect to issue a final report approximately 45 days after an FCC Report and Order creating the band.

This interim report recommends that the ARRL encourage and support the creation of point-to-point high-speed digital links in this band in a form which permits them to be linked into a network.

The multiplicity of tasks which are a part of providing the ARRL support and leadership in the establishment of the network, suggests some sort of "Project Management" would be beneficial. Monitoring the various ARRL support activities will help assure that everything is "fitting" together. When the time comes that adjustments to the current plan must be made, the existence of a monitoring group can facilitate those adjustments.

We suggest that the Board authorize the existing 219 Committee to assume the role of "Project Manager", and to perform that function for at least one year following establishment of the 219-220 MHz band.

APPENDIX A

219-220 MHz Band Plan

Local Coordinating Bodies should coordinate this band such that ten 100-KHz Primary channels are created centered on the following frequencies:

Channel A 219.050
Channel F 219.550
Channel B 219.150
Channel G 219.650
Channel C 219.250
Channel H 219.750
Channel D 219.350
Channel I 219.850
Channel E 219.450
Channel J 219.950

Use of two of these channels in combination to achieve a full duplex environment is desirable.

Since the use of the band is for point-to -point fixed operation with a maximum of 50 watts PEP, and non-interference with Primary Users of the band is mandatory, highly directional antennas with horizontal polarization are recommended.

Because the plan for this band is use for inter-city links which can be assembled into a nationwide high-speed digital network, allocation of channels to point-to-point pairs running less than 56 Kilobits duplex

should be discouraged. No matter what the bandwidth of the transmissions coordinated into a channel, they should be centered in the channel. The long term objective for digital transmission on these channels is 100 KHz bandwidth. Local Coordinating Bodies should seek to avoid decisions which will limit the nationwide network.

APPENDIX B

****
The drafting of this document was incomplete at the time of submittal. One of our members was located in the California Earthquake area and we were unable to communicate with him to achieve consensus on this part. The material below should be considered indicative of the Committee thinking, but should not be viewed as Committee consensus. We will complete this section and distribute it as quickly as possible after January 22, 1994.

****

PROPOSED PROCEDURE
FOR COORDINATION OF AMATEUR RADIO
OPERATION ON THE 219-220 MHz BAND

I. PURPOSE

To define the process and procedure for obtaining coordination of an Amateur Radio point-to-point relay link in the 219-220 MHz band.

II. GENERAL

A. The Amateur Radio Service is authorized to operate wide band point-to-point digital relay links in the 219-220 MHz Band on a secondary basis. Regulations require notice and coordination in order to ensure that Amateur Radio operations do not interfere with Primary Licensees.

B. The ultimate responsibility for complying with the registration, notification, and non-interference provisions of the Regulations lies with the individual Amateur Radio Operator. This procedure is designed to assist the Amateur in complying with those Regulations, and to facilitate the orderly and efficient coordination of those Amateurs that wish to utilize the Band.

C. The 219-220 MHz allocation offers a unique opportunity for implementation of full-duplex wide band digital circuits at a frequency where longer distance propagation is possible. Therefore, it is recommended that the Band usage be limited to such a service, and that implementations which inefficiently use he recommended 100 KHz bandwidth be avoided.

D. The Amateur Radio Service has recognized Spectrum Management and Repeater Coordination Organizations which function in a large portion of the Country. This procedure envisions that these organizations and the American Radio Relay League (ARRL) will,

where appropriate, assist the individual Amateur in complying with the Regulations and good usage practices.

E. The ARRL volunteered to establish and maintain a data base which contains information on all known Primary Licensees and their Systems. This data base includes information on operations located adjacent to the Band. WaterCom, a major AMTS Licensee, has entered into an agreement with the ARRL to assist in this process. The ARRL will also maintain a record of all authorized and coordinated Amateur Radio Stations operating in the 219-220 MHz Band.

F. Resolution of interference to Primary Licensees' is facilitated by providing contact information on coordinated 219 MHz Amateur operations from the ARRL database.

III. DEFINITIONS

For the purposes of this procedure, the following definitions apply.

A. ARRL 1.25M Data Base (ARRL 1.25M DB) - A data base that contains licensing information for non-Amateur Primary and Secondary Users in the 216-222 MHz frequency segment. It includes Amateur Users in the 219-220 MHz Band that have obtained operational coordination in accordance with this procedure.

B. ARRL Data Base Manager (ARRL DBM) - The ARRL representative responsible for maintaining the ARRL 1.25M Data Base.

C. LOCAL COORDINATING BODY (LCB) - The applicable Spectrum Management organization recognized under 47 C.F.R. Part 97.201(c). This function will normally exist in one of the following forms:

1. A spectrum management organization that has some responsibility for reviewing and authorizing 220 MHz repeater operations, and which performs band usage planning for the non-repeater activities.

2. A spectrum management organization that has some responsibility for reviewing and authorizing 220 MHz repeater operations, and which has delegated band usage planning and coordination of digital activities to a sub-unit.

3. A spectrum user (user group) who is in an area not serviced by either #1 or #2 above.

IV. PROCEDURE

A. Application for Coordination

1. The applicant network segment implementor will determine a path where use of the 219-220 MHz band might be applicable. The applicant discuss plans with the local digital planners and their LCB.

2. After identifying Latitude and Longitude information for each location, the user will submit a "Request for 219 Data" to the ARRL

DBM. This request may be forwarded through the LCB or submitted directly to League Headquarters. (Depending upon prior activity, the LCB may have the required information already in their files. Actual submittal of the request may initially be by mail, but it is envisioned that this inquiry should be available via electronic distribution in the long term.)

3. The information returned by the ARRL DBM will include data on all known operations within approximately 250 miles of the identified sites. If standardized software tools for evaluating path and site selection are available, they will be provided upon request.

4. The User is expected to apply the available models to determine if the proposed segment is practicable, and if it falls into either the class of stations that will require permission, or the ones that require notification.

a. Stations located within 50 miles of an AMTS Shore Station are required to obtain permission from the Shore Station Licensee, and

b. Stations located between 50 and 150 miles of an AMTS Shore Station are required to Notify the AMTS Licensee 15 days prior to operation.

5. Once the User determines that operation in the proposed segment without interference to another user is possible, a formal "Request for Coordination" must be submitted to the LCB. Each LCB may require slightly different information, but normally it will include:

a. Administrative data related to the applicant,
b. System data to illustrate how this segment will be integrated into the network,
c. Engineering data for path propagation, and
d. Engineering data documenting non-interference w/other services.

6. The LCB will act on the request based upon regular locally developed procedures. This action will be one of the following:

a. If acceptable and no notice provisions apply, issue a "Notice of Test Coordination" in accordance with local policy.

b. If acceptable and Notice is required, issue a "Notice of Test Coordination" and inform the. User that they are to mail a copy of the "Notice of Proposed Operation" to all impacted Licensees by Certified Mail.

(1) A "Notice of Proposed Operation" must include instructions for Licensee to copy LCB on any correspondence that may be sent on the matter.

(2) The User is responsible for supplying LCB with copies of mailing Certification Form(s).

c. If acceptable, and AMTS Licensee Permission is required, notify the User of acceptable application and instruct him to apply for permission to test from AMTS Licensee. Upon receipt of written acceptance from AMTS Licensee, issue "Notice of Test Coordination".

(1) Request for permission to test must include instructions for Licensee to copy LCB on any correspondence that may be sent on the matter.

(2) User is responsible for supplying LCB with copies of all documentation.

d. If acceptable but another Amateur circuit may be in position to be impacted, issue a "Notice of Test Coordination" and provide co-/ adjacent channel notification.

e. If acceptable and multiple notification procedures apply, comply with each as per above.

f. If unacceptable, deny the request.

7. The LCB will forward a copy of all "Notices of Test Coordination" to the ARRL DBM.

8. Upon satisfactory completion of the Test Coordination Period, the LCB issues User a "Notice of Coordination" and forwards a copy to the ARRL DBM.

a. Operations requiring the permission of an AMTS Licensee shall require that the User obtain a final written permission before the LCB will issue a "Notice of Coordination".

9. The ARRL DBM will include a "Notice of Test Coordination" data in the ARRL 219 DB for as long as the test coordination is in effect, and will cause the "Notice of Coordination" data to be added permanently.

[B. De coordination as a Result of Primary Licensee Changes]

To be determined.

C. Primary User Problem Resolution

A phone, fax or written problem notification may be made by the Primary spectrum user to the Coordinated Amateur, the LCB, and the ARRL. The ARRL will register all correspondence related to the complaint, and assist as appropriate, in the resolution process.

Amateur users will need to recognize that when the primary user is no longer satisfied with sharing the spectrum, that the Amateur operation may need to cease. This can be constrained through an agreement with the FCC and/or primary spectrum users detailing technical standards.

Alternative Proposal for Section IV

IV. Procedure

A. Application for Coordination

1. The prospective applicant requests procedural information including engineering software and database from the LCB.

2. The applicant performs latitude, longitude, and engineering analysis, with the assistance of the LCB if necessary, and submits the results on a form to the LCB.

3. The LCB reviews the application, including the proposed location, propagation and radiation pattern engineering, equipment, frequency selection, and primary and amateur co-channel user database, and notifies the applicant of the results.

If there is judged to be no potential interference to existing primary (AMTS) and co-channel amateur users, but the applicant is within 50 or 150 miles of a primary user, the LCB issues a notification of provisional coordination pending notification and/or permission request to the primary user by the applicant, and a successful on-the-air non-interference test.

If the LCB does not receive a copy of the notification and/or permission request from the applicant within 60 days, the provisional coordination is declared null and void by the LCB with a written notice to the applicant.

If the applicant is not within 50 or 150 miles of a primary user or existing amateur co-channel user, the LCB issues a Notice of Provisional Coordination pending an on-the-air non-interference test only.

If the LCB finds that there is potential interference to the primary and co-channel users based on the application information, a notice is sent by the LCB to the applicant to that effect and requesting a re-engineering study.

4. Upon receipt of the copy of the applicant's notification/permission request letter, the LCB issues the notice of provisional coordination pending the non-interference test.

5. If the non-interference test is successful, and the primary user grants permission to an applicant within 50 miles of its station, the applicant is granted a Certificate of Coordination, and notice of same is forwarded by the LCB to the ARRL DBM.

6. If the test is not successful, the LCB issues a letter instructing the applicant to re-engineer the system. If the applicant chooses not to re-engineer the system, the pending application is canceled.

359. Going to TAPR Conf?

I'm interested to know who's going to the TAPR conference in
Tuscon at the begining of next month (March)?
I went last year and had fun and even learn a few things. I'm going
this year so I hope it will be more of the same.

Steve, KN6XQ

Yesterday I posted a request for laptop software to run
with my newly installed TNC to make packet a bit nicer.

I had several responses that I should get "PaKet 5.1".

I checked my QRZ CD ROM but did not find it. Does anyone know
of an ftp site where I could find this? I would like to take
a look at the software as it seems to be the overwhelming favorite
of the folks that responded to my post. And thanks again to those
that send me mail. After just a couple days on packet I've now
recieved several packet messages from people in the area that have
seen me on and are welcoming me to packet. 73, Dale.

TAPR 1994 Annual Meeting

Join some of the brightest and most enthusiastic of today's packet pioneers at TAPR's annual meeting on March 4th, 5th, and 6th, 1994, in Tucson, Arizona. TAPR (Tucson Amateur Packet Radio), a non-profit research and development corporation, was instrumental in the development of the packet TNC and continues work on digital communications advancements and education.

The meeting informally begins Friday afternoon with the opening of the hospitality suite and continues later that evening with dinner. Dinner is always low-key and provides a great opportunity for those who arrive Friday to discuss and chat about projects before the rest of the weekend begins. Friday evening, after dinner, the first meeting of the Regional Networkers Special Interest Group will be held.

The annual meeting formally begins Saturday with presentations and papers on several exciting new hardware and software projects as well as discussion on other projects of interest throughout the day. A mini-symposium concerning future directions in amateur packet radio will be held during the afternoon session. Issues concerning packet networking and BBS operation are also anticipated. Saturday evening, after the TAPR dinner, will feature an open forum during which attendees will be given an opportunity to influence the future direction and research with which TAPR is involved. After the TAPR forum, the first meeting of the TAPR BBS Special Interest Group will be held.

On Sunday, a special NOS TCP/IP workshop will be led by Johan Reinalda, WG7J/PA3DIS, principal author and developer of JNOS. Johan will also be available for more advanced discussions about JNOS and related activities.

These are exciting times for packet and TAPR. This year's meeting should be a super-charging event for everyone who can attend!

Call for Papers

Papers are welcome from everyone. Although there is limited time during the weekend, all attempts will be made to allow those present to talk. Deadline for submission of papers is Monday, February 7th, 1994. Contact the TAPR office to request an author's information package. Contact Keith Justice, Program Chairman, (Internet: kf7tp@kf7tp.stat.com) for additional information.

Meeting Place and Accommodations

The TAPR Annual Meeting, all presentations and meetings, will be held at the Best Western Inn at the Airport, 7060 South Tucson Boulevard, Tucson,

Arizona 85706. Phone (602) 746-0271. The room rate is $54 per night, which includes a complimentary full American breakfast buffet and daily complimentary cocktails with hors d'oeuvres between 5 and 6 PM.

The restrictions on amateur use of that band are like no other; they're much, much more stringent, both in the kind of use allowed (in this case, *only* digital point-to-point links) and in that we are secondary in the band to an active primary user. There are a lot of hoops to jump through just to make sure that we use the band within the restrictions placed on us in the first place.

>Couple that with the latest proposal that indemnifies ham frequency
>coordinating bodies from lawsuits and redress,

What proposal is this? If you're referring to the bill that protects volunteer examiners and OOs, it didn't (last time I looked) indemnify coordinators. (I think it should, but that's a subject for .policy.) (Maybe this whole thread is, too.)

Don't let a piece of the sky hit you on the head.

>Should we just let NABER handle the coordination?

No, but we should officially recognize coordinators in the amateur service.

>We should see how this turns out in the NPRM, and be sure to comment
>upon it vigorously.

No doubt. I intend to.

From: aa360@FreeNet.Carleton.CA
Message-ID: <CKr74E.8wu@freenet.carleton.ca>
Source record: 50163

I've got the enhanced version of FFTMorse put out by Rocco Caputo and for the life of me, I can't get it to work with my SBPro CT1330Rev 2 card. The program refuses to recognize my card despite the fact that I've updated the CT-Voice.drv to 2.1 and changed iterrupts/reinstalled from scratch/ etc. The card works well otherwise; just can't get Morse.exe to recognize it. It reports a card type -1 which Rocco says means that it does not recognize my card as a valid type, so my BLASTER var (a220 i5 d1 t2) is of course deemed to be wrong, and the program terminates.

Anyone have a similar problem, and played with the
morse.exe C source code to fix this annoying fatal error??!!
Or will I be forced to go to HamBlaster.....

The KISS TNC: A simple Host-to-TNC communications protocol
==

Mike Chepponis, K3MC, Phil Karn, KA9Q

ABSTRACT

The KISS[1] TNC provides direct computer to TNC communication using a
simple protocol described here. Many TNCs now implement it, including
the TAPR TNC-1 and TNC-2 (and their clones), the venerable VADCG TNC,
the AEA PK-232/PK-87 and all TNCs in the Kantronics line. KISS has
quickly become the protocol of choice for TCP/IP operation and multi-
connect BBS software.

1. Introduction

Standard TNC software was written with human users in mind;
unfortunately, commands and responses well suited for human use are
ill-adapted for host computer use, and vice versa. This is especially
true for multi-user servers such as bulletin boards which must
multiplex data from several network connections across a single
host/TNC link. In addition, experimentation with new link level
protocols is greatly hampered because there may very well be no way at
all to generate or receive frames in the desired format without
reprogramming the TNC.
The KISS TNC solves these problems by eliminating as much as possible
from the TNC software, giving the attached host complete control over
and access to the contents of the HDLC frames transmitted and received
over the air. This is central to the KISS philosophy: the host

software should have control over all TNC functions at the lowest possible level.
The AX.25 protocol is removed entirely from the TNC, as are all command interpreters and the like. The TNC simply converts between synchronous HDLC, spoken on the fullor half-duplex radio channel, and a special asynchronous, full duplex frame format spoken on the host/TNC link. Every frame received on the HDLC link is passed intact to the host once it has been translated to the asynchronous format; likewise, asynchronous frames from the host are transmitted on the radio channel once they have been converted to HDLC format. Of course, this means that the bulk of AX.25 (or another protocol) must now be implemented on the host system. This is acceptable, however, considering the greatly increased flexibility and reduced overall complexity that comes from allowing the protocol to reside on the same machine with the applications to which it is closely coupled.
It should be stressed that the KISS TNC is intended only as stopgap. Ideally, host computers would have HDLC interfaces of their own, making separate TNCs unnecessary. [15] Unfortunately, HDLC interfaces are rare, although they are starting to appear for the IBM PC. The KISS TNC therefore becomes the ``next best thing'' to a real HDLC interface, since the host computer only needs an ordinary asynchronous interface.

2. Asynchronous Frame Format

The ``asynchronous packet protocol'' spoken between the host and TNC is very simple, since its only function is to delimit frames. Each frame is both preceded and followed by a special FEND (Frame End) character, analogous to an HDLC flag. No CRC or checksum is provided. In addition, no RS-232C handshaking signals are employed.
The special characters are:

Abbreviation Description Hex value

FEND Frame End C0
FESC Frame Escape DB
TFEND Transposed Frame End DC
TFESC Transposed Frame Escape DD

The reason for both preceding and ending frames with FENDs is to improve performance when there is noise on the asynch line. The FEND at the beginning of a frame serves to ``flush out'' any accumulated garbage into a separate frame (which will be discarded by the upper layer protocol) instead of sticking it on the front of an otherwise good frame. As with back-to-back flags in HDLC, two FEND characters in a row should not be interpreted as delimiting an empty frame.

3. Transparency

Frames are sent in 8-bit binary; the asynchronous link is set to 8 data bits, 1 stop bit, and no parity. If a FEND ever appears in the data, it is translated into the two byte sequence FESC TFEND (Frame

Escape, Transposed Frame End). Likewise, if the FESC character ever appears in the user data, it is replaced with the two character sequence FESC TFESC (Frame Escape, Tran- sposed Frame Escape).
As characters arrive at the receiver, they are appended to buffer containing the current frame. Receiving a FEND marks the end of the current frame. Receipt of a FESC puts the receiver into ``escaped mode'', causing the receiver to translate a following TFESC or TFEND back to FESC or FEND, respectively, before adding it to the receive buffer and leaving escaped mode. Receipt of any character other than TFESC or TFEND while in escaped mode is an error; no action is taken and frame assembly continues. A TFEND or TESC received while not in escaped mode is treated as an ordinary data character. This procedure may seem somewhat complicated, but it is easy to implement and recovers quickly from errors. In particular, the FEND character is never sent over the channel except as an actual end-of-frame indication. This ensures that any intact frame (properly delimited by FEND characters) will always be received properly regardless of the starting state of the receiver or corruption of the preceding frame.
This asynchronous framing protocol is identical to ``SLIP'' (Serial Line IP), a popular method for sending ARPA IP datagrams across asynchronous links. It could also form the basis of an asynchronous amateur packet radio link protocol that avoids the complexity of HDLC on slow speed channels.

4. Control of the KISS TNC

Each asynchronous data frame sent to the TNC is converted back into ``pure'' form and queued for transmission as a separate HDLC frame. Although removing the human interface and the AX.25 protocol from the TNC makes most existing TNC commands unnecessary (i.e., they become host functions), the TNC is still responsible for keying the transmitter's PTT line and deferring to other activity on the radio channel. It is therefore necessary to allow the host to control a few TNC parameters, namely the transmitter keyup delay, the transmitter persistence variables and any special hardware that a particular TNC may have.
To distinguish between command and data frames on the host/TNC link, the first byte of each asynchronous frame between host and TNC is a ``type'' indicator. This type indicator byte is broken into two 4-bit nibbles so that the low-order nibble indicates the command number (given in the table below) and the high-order nibble indicates the port number for that particular command. In systems with only one HDLC port, it is by definition Port 0. In multi-port TNCs, the upper 4 bits of the type indicator byte can specify one of up to sixteen ports. The following commands are defined in frames to the TNC (the ``Command'' field is in hexadecimal):

Command Function Comments

0 Data frame The rest of the frame is data to be sent on the HDLC channel.

1 TXDELAY The next byte is the transmitter
keyup delay in 10 ms units. The
default start-up value is 50
(i.e.,500ms).

2 P The next byte is the persistence
parameter, p, scaled to the range 0 -
255 with the following formula:

P = p * 256 - 1
The default value is P = 63
(i.e., p = 0.25).

3 SlotTime The next byte is the slot interval in
10 ms units. The default is 10
(i.e., 100ms).

4 TXtail The next byte is the time to hold up
the TX after the FCS has been sent,
in 10 ms units. This command is
obsolete, and is included here only
for compatibility with some existing
implementations.

5 FullDuplex The next byte is 0 for half duplex,
nonzero for full duplex. The default
is 0 (i.e., half duplex).

6 SetHardware Specific for each TNC. In the TNC-1,
this command sets the modem speed.
Other implementations may use this
command for other hardware-specific
functions.

FF Return Exit KISS and return control to a
higher- level program. This is
useful only when KISS is incorporated
into the TNC along with other
applications.

The following types are defined in frames to the host:

Type Function Comments

0 Data frame Rest of frame is data from the HDLC
channel

No other types are defined; in particular, there is no provision for
acknowledging data or command frames sent to the TNC. KISS
implementations must ignore any unsupported command types. All KISS
implementations must implement commands 0,1,2,3 and 5; the others are
optional.

5. Buffer and Packet Size Limits

One of the things that makes the KISS TNC simple is the deliberate lack of TNC/host flow control. The host computers run higher level protocol (typically TCP, but AX.25 in the connected mode also qualifies) that handles flow control on an end-to-end basis. Ideally, the TNC would always have more buffer memory than the sum of all the flow control windows of all of the logical connections using it at that moment. This would allow for the worst case (i.e., all users sending simultaneously). In practice, however, many (if not most) user connections are idle for long periods of time, so buffer memory may be safely ``overbooked''. When the occasional ``bump'' occurs, the TNC must drop the packet gracefully, i.e., ignore it without crashing or losing packets already queued. The higher level protocol is expected to recover by ``backing off'' and retransmitting the packet at a later time, just as it does whenever a packet is lost in the network for any other reason. As long as this occurs infrequently, the performance degradation is slight; therefore the TNC should provide as much packet buffering as possible, limited only by available RAM.
Individual packets at least 1024 bytes long should be allowed. As with buffer queues, it is recommended that no artificial limits be placed on packet size. For example, the K3MC code running on a TNC-2 with 32K of RAM can send and receive 30K byte packets, although this is admittedly rather extreme. Large packets reduce protocol overhead on good channels. They are essential for good performance when operating on high speed modems such as the new WA4DSY 56 kbps design.

6. Persistence

The P and SlotTime parameters are used to implement true p-persistent CSMA. This works as follows:
Whenever the host queues data for transmission, the TNC begins monitoring the carrier detect signal from the modem. It waits indefinitely for this signal to go inactive. When the channel clears, the TNC generates a random number between 0 and 1.[2] If this number is less than or equal to the parameter p, the TNC keys the transmitter, waits .01 * TXDELAY seconds, and transmits all queued frames. The TNC then unkeys the transmitter and goes back to the idle state. If the random number is greater than p, the TNC delays .01 * SlotTime seconds and repeats the procedure beginning with the sampling of the carrier detect signal. (If the carrier detect signal has gone active in the meantime, the TNC again waits for it to clear before continuing). Note that p=1 means ``transmit as soon as the channel clears''; in this case the p-persistence algorithm degenerates into the 1-persistent CSMA generally used by conventional AX.25 TNCs.
P-persistence causes the TNC to wait for an exponentially-distributed random interval after sensing that the channel has gone clear before attempting to transmit. With proper tuning of the parameters p and SlotTime, several stations with traffic to send are much less likely to collide with each other when they all see the channel go clear. One transmits first and the others see it in time to prevent a collision, and the channel remains stable under heavy load. See references [1] through [13] for details.

We believe that optimum p and SlotTime values could be computed automatically. This could be done by noting the channel occupancy and the length of the frames on the channel. We are proceeding with a simulation of the p-persistence algorithm described here that we hope will allow us to construct an automatic algorithm for p and SlotTime selection.
We added p-persistence to the KISS TNC because it was a convenient opportunity to do so. However, it is not inherently associated with KISS nor with new protocols such as TCP/IP. Rather, persistence is a channel access protocol that can yield dramatic performance improvements regardless of the higher level protocol in use; we urge it be added to every TNC, whether or not it supports KISS.

7. Implementation History

The original idea for a simplified host/TNC protocol is due to Brian Lloyd, WB6RQN. Phil Karn, KA9Q, organized the specification and submitted an initial version on 6 August 1986. As of this writing, the following KISS TNC implementations exist:

TNC type Author Comments

TAPR TNC-1 Marc Kaufman, Both download and dedicated ROM
& clones WB6ECE versions.

TAPR TNC-2 Mike Chepponis First implementation, most
& clones K3MC widely used. Exists in both
downloadable and dedicated ROM
versions.

VADCG TNC Mike Bruski, Dedicated ROM.
& Ashby TNC AJ9X

AEA PK-232 Steve Stuart, Integrated into standard AEA
PK-87 N6IA firmware as of 21 January 1987.
The special commands ``KISS
ON'' and ``KISS OFF'' (!)
control entry into KISS mode.

Kantronics Mike Huslig Integrated into standard
Kantronics firmware as of
July 1987.

The AEA and Kantronics implementations are noteworthy in that the KISS functions were written by those vendors and integrated into their standard TNC firmware. Their TNCs can operate in either KISS or regular AX.25 mode without ROM changes. The TNC-1 and TNC-2 KISS versions were written by different authors than the original AX.25 firmware. Because of the specialized development environment used for the TNC-1 code, and because original source code for the TNC-2 was not made available, the KISS authors wrote their code independently of the standard AX.25 firmware. Therefore these TNCs require the installation of nonstandard ROMs. Two ROMs are available for the TNC-

2. One contains ``dedicated'' KISS TNC code; the TNC operates only in the KISS mode. The ``download'' version contains standard N2WX firmware with a bootstrap loader overlay. When the TNC is turned on or reset, it executes the loader. The loader will accept a memory image in Intel Hex format, or it can be told to execute the standard N2WX firmware through the ``H''[3] command. The download version is handy for occasional KISS operation, while the dedicated version is much more convenient for full-time or demo KISS operation.
The code for the TNC-1 is also available in both download and dedicated versions. However, at present the download ROM contains only a bootstrap; the original ROMs must be put back in to run the original TNC software.

8. Credits

The combined ``Howie + downloader'' ROM for the TNC-2 was contributed by WA7MXZ. This document was expertly typeset by Bob Hoffman, N3CVL.

[1] ``Keep It Simple, Stupid''
[2] To conform to the literature, here p takes on values between 0 to
1. However, fractions are difficult to use in a fixed point
microprocessor so the KISS TNC actually works with P values that
are rescaled to the range 0 to 255. To avoid confusion, we will
use lower-case p to mean the former (0-1) and upper-case P
whenever we mean the latter (0-255).
[3] For ``Howie'', of course.

Hi All!

Well, I managed to hear the shuttle's packet radio this morning, but I have no Idea what call sign to connect to. Or for that matter what is the procedure once you do connect. Could someone give a brief tour of connecting to the Shuttle and getting a QSL card?

Also, can I recieve the equivalent of a QSL card for just hearing them?

Excuse me, isn't that just the other way round? I mean, isn't there a
difference between encapsulation *IN* AX.25 packets and encapsulation *OF*
AX.25 packets.

RFC-1226 says:
This memo describes a method for the encapsulation of AX.25 (the
Amateur Packet-Radio Link-Layer Protocol) frames within IP packets.

Anyway, don't get me wrong, I don't want to nail anyone down. I'm just
interested in finding some documentation about encapsulation of IP, ICMP and
ARP packets within AX.25 frames.

I have been involved in the setting up of a 9600 baud digital regenerating repeater. In our implementation we also regenerate the transmit clock to remove any phase jitter from the incoming signal and delay the data by a few bits to give the transmitter time to key up.

Mail me if you'd like more information.

I second the comments on PC-DSP, about 30 bucks. There's a new book
by the same author, probably superceding it. OP-AMP books in LA gave
me great service on my copy.

I also recommend the TI 'c26 DSK module - a TMS320C26, their analog
interface chip, with a spot for an input phono plug and output of same,
for audio; an rs232 port to talk to your pc, and a 9vac connector for power.
Great utilities with it. Loook also for W9GR's code and otehr
programs which have been p;orted by Johan Ferrer to teh DSK. Great
learning tools

Source record: 50172

Hi Brian. I m going to try to be polite as possible here. I don t know ur technical background, or level of understanding of radio.

Ur last message proposed doing T1 multi-level signalling on 220 for terrestrial paths. I think. If u work thru the calculations in my article, u will find that u will need a tremendous amount of power to achieve aceptable Carrier to Noise ratios for reliable use of the T1 QAM signalling. Digital microwave radio links, which the T1 Qam is used on typically have C/N ratios at 50 or 60 dB, over the BW of the QAM, which is significantly broader than the 80 Kc noise BW of the 56 KB MSK. But assuming it was the same BW, the 25 mile link would need another 20 dB of C/N ratio, or in excess of 400 watts. And if we are unlucky, with an out of the average noise source, several times more power could be needed.

Why hasn t ham radio used multi level signalling at VHF and UHF ? Because we don t have the C/N ratio. And neither do the pro's. They don t use multi-level signalling on VHF and UHF either. Multi level signalling trades C/N requirements for data rate. In VHF and UHF radio, we don t have enuf C/N to start with. So, we need the best C/N modems. And these are not going to be multi level modems.

The more Information BW , the more power is required at the receiver. All things the same, this means a bigger transmitter.

I m glossing over a bunch of stuff here. Its cheaper to go higher sometimes. But then if don t increase the range of the link, u are going to have too much RF into the next area over. Do this enuf times, and u end up with 145.01. Yea, U and I and whoever, can get on top of two mountains and do a T1 link for 70 miles. But can u put a whole network of these on and have them coexist? That s the problem here. Not ur own private Internet link to the desert hide-away. If u want higher baud rates, u have to go higher in Frequency. If u can t come up with the loot to do real microwave links, ur not going to be able to build a NETWORK, with T1 baud rates. A link here or there, yea sure, as long as the RF spilage goes out into Pacific Ocean, and a place where nobody lives (the desert).

73, Don.

377. F6FBB BBS v5.15c update available with ftp

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-02-06 15:38:16 UTC
From: mto@gate.compart.fi
Message-ID: <2j32t8$cck@gate.compart.fi>
Source record: 50177

A new official update (v5.15c) to the F6FBB BBS is
available with anonymous ftp from ftp.funet.fi. The
files are in the directory /pub/ham/packet/bbs/f6fbb.

In addition, in the lang subdirectory you can find two English
language files for FBB written in British style.

The complete 5.15c update is in 515c.exe.

All the *.BIN files changed since 5.15b are available seperately
in 515c.zip.

Fixed since 5.15b :

BPQ-problem (more than 1 COM-port in BPQ)
S-line without spaces.
= command
> command
Forward mix-up
PN->PF
Format-error (FE) loop
Crash in satellite-server
Timeout during YAPP-download from console (F9).
HOLD and REJECT is now OK via IMPORT
CLR_USER: Clear users every time.
SID sent before C_FILTER.
Arrow-keys OK with 286.
Forward-bug fixed.
"Cannot write to file" (PROBABLY !!) fixed.
YN on several drives.
Messages were marked D even without 7+.
New EPURMESS: No space after $ in OLDMAIL.

: Why do the cognoscenti here prefer the KAM, anyway?

Well, I've used (or rather - TRIED to use) the PK-232 and was totally frustrated by it. I do OWN and USE the MFJ-1278, a TNC-2, and a KAM. I bought all the machines but was given the KAM by another ham. My favorite machine is definitely the KAM for a simple reason. I am a DXer and Contester. Of the machines mentioned, only the KAM is dual-port meaning that I can operate V/UHF packet (i.e. PacketCluster) at the SAME TIME that I am operating HF digital modes. For me, that is the primary reason why I prefer the KAM. If the MFJ-1278 was a dual-port machine, I would probably prefer that one.

Cheers de Sandy WA6BXH/7J1ABV WA6BXH@N0ARY slay@netcom.com

Transient Electromagnetic Pulse Emanation Standard (TEMPEST) is the US standard defining the amount of electromagnetic radiation that a device may emit without compromising the information it is processing.

In the US it not illegal to posess TEMPEST-surveillance equipment but it is illegal to take appropriate counter-measures to prevent surveillance. The US government has refused to release details of its TEMPEST research and has restricted the dissemination of independent research by classifying it.

The US Drug Enforcement Agency (DEA) makes use of TEMPEST secured electronics and computers as they believe that the drug cartels may possess surveillance equipment.

I am interested in gathering comments on the social, legal, ethical, and technical aspects of use of TEMPEST surveillance equipment in the US and Europe with the aim of including it in a discussion of the threats to computer/digital systems.

Please reply by E-mail. I will provide a summary to anybody who requests one.

thanks, - Rob Jackson

(more information on TEMPEST can be found in the paper "Eavesdropping On the Electromagnetic Emanations of Digital Equipment: The Laws of Canada, England, and the US" by Cristopher Seline - available on FTP from csrc.ncsl.nist.gov)

In no way does that equate to it being illegal to attempt to
suppress spurious electromagnetic radiation from computing devices. The
FCC even has rules requiring EMI/RFI filtering & suppression for
civillian & commercial computers & peripherals, albeit not in the name
of national security.

>The US Drug Enforcement Agency (DEA) makes use of

Yes & no. Some DEA processing machines contain or are capable of
accessing classified information. That alone requires the machines and/or
their containing room to meet certain TEMPEST criteria. The classified
info is what necessitates TEMPEST, and not specifically the belief that
narcotic organizations are using Van Eck devices, etc.

384. Hamblaster Update

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-02-07 18:21:59 UTC
From: jwa@tellabs.com
Message-ID: <1994Feb7.182159.13953@tellab5.tellabs.com>
Source record: 50179

The Hamblaster Update

Over the past several months I posted updates about a
DSP "The Hamblaster" that Will Torgrim (N9PEA) and myself
are developing.

We are focusing our efforts on a packet modem that allows
the user to improve H.F. reception by interfacing the Ham-
blaster (a PC compatable DSP sound board) to a transceiver
and a packet or all mode TNC. Modems/filters for RTTY,
Packtor, Amtor are also under developement and are compatable
with the same control panal software.

Here are the latest developements
1-31-94

1) External Power supply

I think one feature that separates the Hamblaster
from other sound boards is it's ability to run on
an external 12 volt supply. When a filter or modem
is loaded, You can turn off the computer and
Hamblaster keeps on going and going and going!

When it's connected to a PK-232, there's no need
to keep the computer on in order to keep the DSP
alive. Right now, my PK232/Hamblaster is runing
and it's been operating for about 5 days

2) Adaptive (LMS) filter

There's ongoing developement in this area. We are
planing (I don't think this has been done before)
to add controls to the LMS algorithm.

3) Soundblaster compatibility

The Hamblaster IS NOT soundblaster compatible.
It was designed that way so that it will run
independant of other sound boards. I can still
use my Soundblater to record sound, play music,
load software from the CD or use the midi interface.
At the same time, I can receive packets or use
a DSP filter with my Ham equipment.

Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.misc

Just for fun, here is a bulletin I received a little over a year ago from KH2D@KH2D in Guam entitled *The Ultimate PK-232*:

After reading a bulletin about modifying the PK232 to perform better on AMTOR, which was a reprint of an article from QST magazine, I thought it would be a good time to distribute one more mod for the PK232. The above mentioned article stated that the "PK232 performed BETTER than COMMERCIAL AMTOR equipment". As we say on the ham bands, "hi hi ..... "

The following MOD will make the PK232 work MUCH better in these areas:

1. Improve SENSITIVITY on HF and VHF.
2. Greatly improve the TUNING BAR GRAPH DISPLAY.
3. Get rid of the common RF PROBLEM in the PK232.
(symptoms of this very common problem are: your PK232
sounds like a duck call on HF).
4. Make the PBBS more compatable with full service BBS's.
5. Add remote control of TNC parameters.
6. Add NODE capability.
7. Allow simultaneous use of VHF and HF ports.
8. Add AMTOR mailbox capability.
9. Add FULL DUPLEX capability.
10. Operate PROPERLY in the KISS mode.
11. Add GATEWAY capability.
12. Add SOFTWARE CARRIER DETECT.

This mod can be performed by the average ham very easily with no soldering required and a minimum number of tools.

Please follow these instructions CAREFULLY:

1. Power OFF the PK232.
2. Remove ALL cables connected to the PK232.
3. Grasp the PK232 FIRMLY in your RIGHT HAND (left hand is OK if you are LEFT-HANDED).
4. Carry the PK232 to the nearest trash can and hold it directly above the aforementioned trash can.
5. Drop the PK232 into the trash can.
6. In the space the PK232 used to occupy, install a KANTRONICS KAM with 5.02 (or later) firmware. (After completing this step, you will notice you have MORE SPACE on your shelf or tabletop).

CONGRATULATIONS !! You have just modified your PK232 so that it is now the BEST ALL MODE DATA CONTROLLER available.

An option to steps 3 thru 5 in the modification instructions would be to sell the PK232 to another ham (preferably someone who doesn't know where you live, a new novice operator, or someone you don't like).

For those hams who don't have a PK232 installed at their station, skip steps 1 thru 5 in the above instructions.

The above mod has been thoroughly tested at KH2D BBS and has performed FLAWLESSLY for the last 7 months (multi-user, multi-port).

KH2D assumes no liability for hams who make this mod and can't hit the trash can. CAUTION: the PK232 is so BIG and CLUNKY that it can cause broken bones in your foot. Children should NOT try this modification without the assistance of a responsible adult.

KH2D grants full permission to the ARRL to reprint this modification in QST.

I would also like to express my sincerest thanks to the gentleman who spent his time retyping the article from QST magazine so that hams everywhere who don't receive their very own copy could enjoy it. But I would ask that for his next bulletin he chose a magazine where the technical findings are not based on the amount of advertising dollars spent by the equipment manufacturer.

73, Enjoy the DIGITAL MODES,
Jim KH2D @ KH2D.GUAM.USA.OC

John -

You will need a 9600 baud modem that works with the TNC in question. I
am using an MFJ 1270B + 9600, I have friends who are using the MFJ 1278+9600,
and the Kantronics DataEngine+appropriate K modem. There are others on
the market also.

Most radios will work. The controlling factor is that the radio must
use real FM (not phase mod with pre-emphasis). You will have to modify
the radio to introduce the modulation right onto the modulator (usually
a varactor diode) and pick the received signal directly from the detector
(bypassing de-emphasis, squelch, audio amps etc.) There are quite a
few radios that will work. The Icom 290 and 271 are among them.

One detail I have not seen mentioned anywhere is that the radios (tx+rx)
must be within 500Hz or so or 9600 won't work. Using a multimode radio
is nice because you can usually tune in 1KHz steps. If you're stuck with
5KHz steps and your radio is 1.5KHz (or more) off frequency, it will work
fine for normal FM/rpt amnd even 1200 baud packet but will bw a dismal
failure on 9600 - worse, if you don't know it's off freq, you'll wonder
what's wrong!

70 miles? Sure - depends more on the antennas in use and the terrain
than anything else. Note that 9600 is somewhat more susecptable to
multipath distortion than voice or 1200 baud FM/FSK.

Good luck! - Glenn wb6w@netcom.com or wb6w@n6iiu.nocal.us

>already obsolete.

It's true that *part* of the amateur charter is as an experimental
service, but not all experiments are with hardware. There's plenty
of room in this proposed plan for experiments in network topology,
protocols, interfaces to other network services, and the like.

What the proposed plan does is establish a base of interoperability
at a reasonable speed for the propagation characteristics and available
spectrum of the band segment in question. This is similar in principle
to standardizing a floppy disk format so that systems can easily
exchange data. If everyone went off designing their own floppy formats
and form factors, little data interchange could occur between different
systems.

And, as I noted, experimentalism is only part of the amateur charter.
We're also charged to provide public service communications, and this
intercity network would be a large step in the direction of making
packet a more useful public service mode by making automatic traffic
handling over regional and national distances, with only moderate delay,
more feasible.

>As you know, 56kb over radio is a solved problem, with off-the-shelf
>implementations. There is little experimentation to be done here.
>Do we want to restrict ourselves to this?

Yes. For this application we do want something that has proven
interoperability, and something that's more than a one off experiment.
The goal here is to produce a *network* that links US cities. Experiments
with different RF encodings and speeds can be done on other available
amateur bands without reference to network interoperability. When and
if such techniques prove themselves suitable for use in this band segment
for this intercity networking application, then the FCC can be approached
to change their rules with regard to bauds and bandwidths. Since this
band segment is shared with a commercial user who has priority, we need
to take care that we are good neighbors. Thus signaling schemes that
take up the entire band are not suitable for use here. By having multiple
channels, we can locally assign channels in such a way as to avoid
interference to local operations of the commercial occupant of this
band segment. Any other course is likely an unacceptable sharing plan

that won't gain approval.

I'd rather have this spectrum, even with limits, than not to have
it at all.

Hi,

I'm interested in setting up a full duplex repeater port on our local TCP/IP switch. If anyone has implemented something like this particuliarly using the tapr modem with bit regeneration I'd like to hear about it. I'm also interested in opinions on using an every 10 minute beacon from NOS to serve as the ID. It seems like it would be adaquate to me but I might be missing something.

4 PM CWf Mon, Wed, Fri
4 PM CWs Tue, Thu, Sat, Sun
5 PM CWb Daily
6 PM RTTY Daily
7 PM CWs Mon, Wed, Fri
7 PM CWf Tue, Thu, Sat, Sun
8 PM CWb Daily
9 PM RTTY Daily
9:45 PM VOICE Daily
10 PM CWf Mon, Wed, Fri
10 PM CWs Tue, Thu, Sat, Sun
11 PM CWb Daily

Frequencies (MHz)

CW: 1.818 3.5815 7.0475 14.0475 18.0975 21.0675 28.0675 147.555
RTTY: - 3.625 7.095 14.095 18.1025 21.095 28.095 147.555
VOICE: 1.855 3.99 7.29 14.29 18.16 21.39 28.59 147.555

Notes:
CW frequencies include code practices, Qualifying Runs and CW bulletins.
CWs = Morse Code practice (slow) = 5 - 7.5 - 10 - 13 - 15 WPM
CWf = Morse Code practice (fast) = 35 - 30 - 25 - 20 - 15 - 13 - 10 WPM
CWb = Morse Code Bulletins = 18 WPM
RTTY= Teleprinter Bulletins = BAUDOT (45.45 baud) and AMTOR-FEC (100 Baud).
ASCII (110 Baud) is sent only as time allows.

Code practice texts are from QST, and the source of each practice is given at
the beginning of each practice and at the beginning of alternate speeds.

A DX bulletin replaces or is added to the regular bulletins between 8 P.M. Eastern time Thursdays and 8 P.M. Eastern time Fridays.

On Tuesdays and Saturdays at 6:30 P.M. Eastern time, Keplerian Elements for active amateur satellites are sent on the regular teleprinter frequencies.

In a communications emergency, monitor W1AW for special bulletins as follows: voice on the hour, teleprinter at 15 minutes past the hour, and CW on the half hour.

W1AW is open to visitors during normal operating hours: from 1 P.M. to 1 A.M. on Mondays, 9 A.M. to 1 A.M. Tuesday through Friday, 1 P.M. to 1 A.M. on Saturdays, and from 3:30 P.M. to 1 A.M. on Sundays. FCC licensed amateurs may operate the station from 1 to 4 P.M. Monday through Saturday. Be sure to bring your current FCC amateur license or a photocopy.

Headquarters and W1AW are closed on New Year's Day, President's Day, Good Friday, Memorial Day, Independence Day, Labor Day, Thanksgiving and the following Friday, and Christmas Day. On the first Thursday of September, Headquarters and W1AW will be closed during the afternoon.

392. Pactor, Amtor

I am very interested in digital communications and I am using a TNC on VHF BBS locally. It is good to read messages about local activities and equipment for sale, etc, etc. I never used it for keaboard to keaboard QSO.

In the HF world, I would like to have a short description of the operations going on with those two modes: Amtor and Pactor, before I decide to buy a TNC capable of doing those modes. All your comments will be appreciated.

Regards,
Clem.

What data speed are you trying to get?
According to a Yaesu rep, for 2400 baud or less, you should not try
to use the data jack on the back. You should connect to the microphone
jack on the front. The data jack has been optimized for 9600 baud.

I have a Yaesu 5100 and a PK232-mbx, and it works fine connected via
the front microphone jack.

Hi!

I'm trying to get a 9600-baud packet station together; I already have the TNC/modem end in shape; now I have to take care of the radio.

I'm currently investigating conversion of a "Tac310X" UHF radio. My first concern is receive IF bandwidth; how much is required for 9k6?

The radio has three IF filters; two in the first IF, 21.6MHz, and a third at 455kHz. All three of them seem to have identical bandwidths of 15kHz. Of course, the skirts are a lot tighter after the third filter!

I hoping that the radio will do reasonable 9k6 after I remove or bypass the 455kHz filter. If not, there's the possibility of removing all the filters and putting in a sizable external filter board; there was a PL encode/decode board that I got to remove; plenty of space in there now!

On the plus side, the radio has true FM modulation. It also has separate receive and transmit VCOs. There's even a header connector with the receive discriminator output.

Can anybody tell me what is required in terms of group delay and bandwidth for good 9k6 operation? I might be able to wangle access to a network analyzer....

Thanks in advance,

- Jerry Kaidor, KF6VB

Running open squelch is optimum as long as your TNC/modem has a DCD
circuit that senses the presence of data rather than the presence of
any audio at all. Doesn't the MFJ-1270C have State Machine DCD?
If not, last I checked the State Machine DCD kit is $17 from TAPR,
worth every penny.

Well the existing filters sound way too tight. The rule of thumb
for low modulation index data reception is that the filter has to
be flat through at least twice the symbol rate. Differential group
delay should be less than 10% of the symbol duration.

You can grind through a Fourier transform and get exact figures,
but since custom filters are rarely available, just going to the
next wider size using the rule of thumb is good enough. In this
case you'll likely do best with 30 kHz filters.

G3RUH says that when one of his modems is correctly set up with a rig, the resulting signal is about 20kHz bandwidth. I have managed to get workable signals through 15kHz filters but you need to be really careful with the transmitter and receiver frequencies - if either drifts then the link performance degrades rapidly. Provided your discriminator is linear enough over a wider range, you would benefit from using wider filters. 30kHz is probably the next easy size to get hold of.

403. HAMBLASTER INCORRECT STATEMENTS

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-02-09 14:10:54 UTC
From: n4hy@harder.ccr-p.ida.org
Message-ID: <N4HY.94Feb9141054@harder.ccr-p.ida.org>
Source record: 50206

Howdy:

In a recent spate of messages, we have been told of the capabilities
of the hamblaster. It sounds rudimentary so far but I am sure that
over time the capabilities (new software development) will proceed
and its capabilities will be enhanced and it will make a very
interesting tool for amateur radio communications, experimentation,
and learning DSP. There will be alternatives as you will now be told.

In other messages, John Alberts has told us of the lack of capabilities
of the Sound Blaster 16 with ASP. He is WRONG. I received my Sound
Blaster developers kit via UPS yesterday at last. It is easy to see
how John could have made the mistake he made. The manuals received
in the kit describe two distinct pieces of processing hardware.
One is called the DSP and the other is the ASP. The DSP has all
the limitations mentioned by John in his statements concerning
the capabilities of the Sound Blaster card (or lack thereof). It is
a proprietary gate array surrounding masks from other chip developers
to do stuff like DMA blocks of samples in and out, to convert PCM
to u-LAW, 2 or 4 bit ADPCM, CVSD, etc. It directs the flow of
MIDI commands, etc. It is a pretty neat thing in and of itself
but it is NOT what we want. We want a full blown DSP chip, with
a modified Harvard architecture and at least 16 by 16 bit -> 32 multiply,
accumulate, read new coefficient and data in one instruction time.
THE ASP is a real DSP chip and has all this. It is 512 words of off
chip program memory, 512 words of off chip data ram, 192 words of X RAM
on chip,128 words of Y ram on chip. X ram is program and sample
data, Y RAM would be used for filter coefficients. THIS IS A FULL
BLOWN DSP CHIP. It does NOT have the limitations John has told us
the hamblaster overcomes. Indeed, on the A/D, D/A front, it is quite
clear that the under $300 SB16-ASP is quite a bit MORE CAPABLE than
hamblaster. It has two channels (16 bits each), D/A, and A/D. The
sample rate is completely controllable by uploading a divisor to
the control register. The lowest available rate is 5 Khz and the
highest is 44.1 Khz. The processor runs at 12 MIPS so filters would
execute at around 25 MIPS. This is because it has the typical
DSP feature of multiply two numbers, read the next two, and accumulate
the last result while shifting the pointers in two instruction times.
That is plenty fast. I will be able to do dual channel modems for this
card. Since the thing does not also have a UART, or SIO, we will have
to the HDLC and UART functions on the chip when required. Other DSP
developers have done this all on chip (Finland DSP development group
on the Motorola DSP56001). We will be able to do a lot.

John should be more careful when he makes flat statements about commercially available products. If he were a `real competitor' of Creative Labs, he could get into a bit of a hassle. I am following the philosophy of my dear friend, Phil Karn, in attributing to ignorance when possible, that which could be attributed to malice (in this case, competition). I told John in a reply to his mail that I doubted the accuracy of his statements on the Sound Blaster16 with ASP. I was correct. The Sound Blaster 16 with ASP is available from many places for under $300. The developers kit is $99, available only from Creative Labs. In addition to this, you must have a dsp assembler. The developer's kit provides COMPLETE tools for uploading and downloading programs to the ASP chip.

I will be writing programs for the ASP and giving them away on your favorite ftp sites and through the ARRL download request service. These programs will be the basis of articles for QEX describing the algorithms and the operation of the sound blaster card in amateur radio applications. Phil Karn has devised a new link layer for packet, with FEC, etc. and I will be providing modems that use the ASP. I believe I can provide what the latest hamblaster announcements state and more in short order after I get the assembler for the ASP. I will do this as quickly as possible. I am a bit miffed that I stopped developing the Windows and DOS front ends and display stuff for the SB16 ASP after John's note because I thought the SB16 was too limited. Now it is full steam ahead.

I am a newbie in amature radio, but like to know if there is rig that can do following functions and features.

1. Digital selective calling.
2. Signal encryption, so only A and B can chat, no one else can listen to.
3. A automatic TNC that can manage voice/data/fax switching, when connected with PC, can handle voice mail, e-mail and fax transmission and reception.
4. If operator is away, can configure to away mode, let radio take call (by selcal call sign)and work like a phone answering machine, RBBS or fax machine. When operator is near by, then configure to active mode, so radio will ring like a phone, for operator to pick up the call.

May be I am dreaming, but with recent electronic and digital technology evolution, I believe above feature can be integrated into one total radio system. I know that marine radio will adopt digital selective calling technology for safety purpose, and I hope I can see this kind of feature in Ham rig.

Mike Stansberry (jms@col.hp.com) wrote:

: I can't get that server to accept anonymous ftp, either.

Just keep trying. I got in eventually. The file was not in the published directory, however (and no, of course I don't remember exactly where it was -- it was somewhere around pub/pc/win3/(something) where something may have been archive. They obviously don't leave things lying in the uploads directory for long.

Mine wouldn't work (under 386 enhanced), never did find why. I eventually, as the result of someone else's post about comm drivers, swiched from comm.drv to wfxcomm.drv, and suddenly it worked. Nice program -- but the 50 *pound* registration fee seems higher than most shareware prices I've seen (that's like $100CDN).

: do following functions and features.

: 1. Digital selective calling.
Well, for voice, you can use something called CTCSS (check it out where you
purchase the rig).
: 2. Signal encryption, so only A and B can chat, no one else can listen to.

This is *****STRICTLY BIG TIME ILLEGAL!!!***** You will loose your license.

: 3. A automatic TNC that can manage voice/data/fax switching, when connected
: with PC, can handle voice mail, e-mail and fax transmission and reception.

Although this is not a real answer, the quickest thing I can tell you
is that it's not like the public switched telco network. Voice mail you
say. I've not seen that on radio. I suggest you contact your local
packet users group to find out exactly what it's about. Not that I don't
want to tell you, I guess if you mail me I could send you some private
E-Mail HIHI.

: 4. If operator is away, can configure to away mode, let radio take call
: (by selcal call sign)and work like a phone answering machine, RBBS or
: fax machine. When operator is near by, then configure to active mode,

Firstly, if you have not already done so, stop by one of the local
amatuer radio clubs. They will help you out. They can point you at
the approprate info, especially if you ave not yet obtained a license.
If not, write the FCC. They will send you all the regulations. From that,
it will be clear what is possible, and why.

You should be aware that you will require the U.S. equivalent of an Advanced Amatuer License to have an automated transmitter. To operate any transmitter, of course, you need a license.

Depends on the program and the hardware configuration. DCD (Data Carrier Detect) and CTS are usually used to sample activity (open squelch) by actually reading the presence or absence of signal.

Some programs use the data itself to indicate information transfer.

It is advisable for hardware sense (DCD or CTS), but in a remote node or BBS situation it is not possible to always adjust the squelch control so the actual data is monitored and the squelch is often ignored.

Personally I prefer the former as it is more solid and infinately more reliable in situations where this is a lot of packet activity to be igonored.

I have tried both on TPK and find the hardware (CTS and DCD) to be more reliable

410. Problems with PacComm Handi-Packet

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-02-09 20:13:24 UTC
From: dreid@acorn.co.uk
Message-ID: <2jbg54$28m@acorn.acorn.co.uk>
Source record: 50204

Hiya all,

I've got a bit of a problem with my
PacComm Handi-Packet unit - it now only
dishes out the first 40 characters of its
sign on message - I'm pretty sure most of it is OK
and the RS232 all seems OK.

I wonder if anyone else had trouble with their
PacComm unit with a similar fault?

Looking at the Z80 processor address and datalines
It looks very like the unit is stuck ing a small
look - presumably checking the status of an internal
flag or something - once the initial 40 or so chars
are spewed onto the screen then the processor goes into a

Read,Read,Read, Write loop - I think this is consistant
with it checking a register comparing it - failing and
looping. but woulf appreciate sympathy and constructive
points of view...

Thanks

Doc 'G0BZF'

In order to operate OPEN squelch you'll need to install the TAPR XR2211
DCD MOD (available from TAPR for $15, I think). This will make it so
that your TNC looks for data rather than just 'anything' to do DCD.
This is 'true DCD'.

Hope I've been of help, 73,

RE TPK from a 720K diskette

yes it does work on my T1000 with no HD.

I did have to use version 1.80 though. The program will not fit on the diskette with sufficient space to be of use otherwise. I even deleted the docs too.

The T1000 is NOT a speed demon!. Keep the async line speed down to 1200 or a MAX of 2400 (or you will loose some characters).

Otherwise it's a basic TPK install. DO ensure you have a proper cable too, or you will have the standard problem associated with improper cabling.

I was using a Tiny-2 at 1200 baud (if that makes any difference) to your configuration.

416. regenerating digipeaters etc.

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-02-10 06:29:25 UTC
From: umg@phyvc.AUckland.ac.NZ
Message-ID: <66567.umg@phyvc.auckland.ac.nz>
Source record: 50211

Hi,

Just an explanation perhaps. Having seen quite a number of different systems, here is what one could see as "ranking" list of devices used for relaying data modes. Note that the short form of "digipeater" is just "digi". I'll also restrict myself to AX.25 at 1200 Bd AFSK.

SIMPLE DIGIPEATER

Practically any packet terminal station these days can act as a simple digi. If station A wants to communicate with station C using station B as a digi, it works like this during the connect:

A sends a packet for B, addressed to C. B decodes the packet and hands it on to C in a slightly different format, but on the same radio channel. B does NOT acknowledge this packet. C sends an acknowledge packet to B, which is again decoded, re-encoded and sent to A. It is only now that A knows that its packet has actually arrived. A slightly more intelligent way is to let B knwo either side that it has heard their packets and is going to take care of their delivery. But that's just a small improvement.

The advantage of this kind of device is its simplicity. The disadvantages are that each retransmission by the digi blocks the single radio channel. Also, A and C and perhaps other stations on the channel cannot hear each other's transmissions. As a result, their packet may collide and get lost. All this affects the throughput. Networks based on single radio channel digipeaters are a waste of time, especially when one expects heavy traffic.

DATA REPEATER

This is just an ordinary 2M FM repeater, except that there is no tail. There are mainly two advantages of this system: for each packet from A to C via the data repeater B, only a single transmission blocks the channel instead of two, because the repeater downlinks the packet to C while it is being transmitted by B. The other advantage is that all users on the repeater system can hear each other, and collisions are avoided.

The big disadvantage is that this is a one-hop system, and several hops are hard to realize. There is absolutely NO intelligence involved at the repeater site. Hence, packets that arrive in noisy, but decodable form at the repeater site may be totally garbled by the time they reach their destination. Data repeaters are not a packet network device.

REGENERATING REPEATERS

A standard data repeater would carry just repeat the AFSK tones of the incoming signal - no matter what they are or how crooked they are. You could

actually broadcast Mozart through a standard data repeater without too much of a problem.

Regenerating repeaters overcome the noise problem mentioned in the data repeater paragraph, by acknowledging that it is a data signal going across the repeater. The data signal is decoded into a bit stream, which get immediately re-encoded and retransmitted. Good regenerating repeaters also regenerate the TX clock, i.e., the rate at which the bits come in. This permits a near-perfect output signal stripped of almost all noise. If the packet was decodable at the repeater site, it will almost certainly be decodable at its destination as well.

Still, the regenerating repeater does not address the networking question. You still can't use it reasonably for more than one hop, unless you want a single channel all across the land (and the congestion that goes with it).

DUPLEX DIGIPEATER

The duplex digi solves those problems. Its front end looks exactly like a regenerating repeater and acts as one. However, deep down in the box there's a TNC or similar listening, which can also take over the repeater's transmitter if it wants to.

Station A can now talk TO B, just as if it was a simple digipeater. This way you avoid collisions, while still having an intelligent device sitting at the digi's site.

What is the advantage over the regenerating repeater in terms of throughput? Actually, none... - unless you connect something else to the TNC to help the system get on a network.

NETWORK NODE DIGIPEATER

This animal would typically have a duplex digipeater as its user access. The user access is the port that simple users with their BayCom modems and TNC's connect to. Your local BBS, however, is usually on a different radio channel. So, if you are station A, the digi is station B, and the BBS is station C, this is what happens: the digi B receives your packet on the user port (One radio channel, e.g., on 2M). It decodes the packet, re-encodes it and sends it on to the BBS on a fast link, e.g., 9600 Bd G3RUH on 23 cm. This way,your user channel stays clear for other traffic during the transmission.Also, the users don't have to wait for the acknowlege packet to come from the BBS. The digi acknowledges all incoming packets.

One can easily go on from there: instead of linking only to the BBS, other radio channels can be added that link the network node digi to neighbouring network nodes. This way, it is quite easy to connect to stations far away. Your access channel is not blocked by endless repetitions of the same packet. Instead, the packet which you sent out in 1200 Bd is now routed around the country at higher speeds, typically 9600 Bd or up.

Germany has an excellent example of such a network at work, it extends into many of the neighbouring European countries. No need to rely on your local

BBS - just use a neighbouring one if it is down.

I don't know where you got the 50 pounds from, the registration fee is:

25 pounds.

I thought that was reasonable, considering the work I put into it, and the
size of the target market.

Sorry about the wrong directory, I don't think they clear the uploads too often
I was just unlucky. It is now in:

/pub/pc/win3/utils

Cica is _very_ busy, they have a limit of 35 logins at any one time. I quite
often have to make several attempts in the morning here (very early in Indiana).
I put it at cica though, as that is supposed to be the main MS Windows archive.
If anyone has any other archives that would also be suitable, let me know and I
will try to put it there too. I also find it best to login as ftp rather than
anonymous.

I am glad it worked with wfxcomm, I have not tried it with other than the standard
comm drivers :) Don't know why it wouldn't work with those on yours though. Thanks
for the nice program comment, made my day.

I am currently working the next version, I want it to support multiple TNC's. Any
other ideas?

Oops. Must be all those years of cooking tomato sauces in aluminum pots.

Hmmm. I guess I did the currency conversion twice. Yes, that is much more reasonable, and I'll make your day again soon when my money order arrives! By way of endorsement, I think this one is a "keeper".

73 de Ed Leslie VE3ZVZ

P.S. The *nicest* feature is the scrollback capability -- given 1200bps data speed, and slow half duplex switchover. Saves *a lot* of message re-reading. Given a large received data buffer, you can turn off paging on the BBS, and scan the entire message list as fast as the modem will go, then scroll back to read what you couldn't follow as it came in. *NICE*

You can have the squelch off if you are running some kind of hardware or
software carrier detect. Otherwise you need to have squelch on.....otherwise
you'll never be able to TX.

Yes, I am using N0ARY-1 here in california, send him an internet
Email message and get set up on his machine(s), SUN SPARK II,
quite a setup.

try sending to root@bbs.arasmith.com

his gateway this week has been having some trouble. If you can't get
on let me know.

I seem to remember that there was an article in 73 magazine (I *think* it was
73) that had the schematics for an audio spectrum analyser. Does anyone remember
what issue that was in. I am not lazy, I just don't buy 73 all that often ;-).
Failing that, doen anyone know of any other source of info on the topic ?
Thanks

Yes, I just got off the phone with Yaesu [Amateur] Tech Support and they
indeed confirmed that 2400-baud and below goes through the microphone port.

When asked if 19.2K could be sent through the data port, after explaining
that "nineteen dot two" and "nineteen thousand two hundred" were greater
than 2400, the "tech" replied, and I quote, "You can go that fast???"

Why is it I always get the "tech"s that speak English as a third or
fourth language? My friends get "tech"s that understand what's said
to them. <sigh>

Nonetheless, hoping to get high-speed packet up and going RSN.

Many portables from offshore do include a digital signalling feature,
though the number of characters is limited. FYI, many repeaters will not
pass the digital
signalling information due to distortion in the audio path or muting in the
controller unit.

> 2. Signal encryption, so only A and B can chat, no one else can listen to.

Amateur frequencies and bands are strictly shared, with no provisions for
either
message or conversational privacy. The FCC Rules prohibit codes and
ciphers, and also require that ID be done in either voice or Morse Intl#1.
If you need privacy, moe to a common carrier or commercial system where
such technology is both available and legal (it's not legal in CB/GMRS
either!).

> 3. A automatic TNC that can manage voice/data/fax switching, when connected
> with PC, can handle voice mail, e-mail and fax transmission and reception.

TNCs are inherently and by definition digital devices, with no voice
capability.
The ones I've seen on the market today do not offer automatic mode
detection and switching from packet to RTTY, Morse, AMTOR, or FAX modes.

> 4. If operator is away, can configure to away mode, let radio take call
> (by selcal call sign)and work like a phone answering machine, RBBS or

> so radio will ring like a phone, for operator to pick up the call.

There are several simple interconnects from various suppliers, most of whom
advertise in all the major ham magazines, to allow communications through a

local radio to a portable or mobile. All communications come under
third-party
rules, since the caller is assumed NOT to be a licensed amateur.

>
> May be I am dreaming, but with recent electronic and digital technology

> in Ham rig.

The international Maritime service is considerably different from ham
radio,
both in usage and regulatory structure. Actually it sounds like you are
trying
to operate your amateur station like a smart multi-mode cordless phone for
personal and possibly business use. Even with the recent rules changes,
business
use is prohibited. I hope I'm reading far too much into your comments.

427. ? WEFAX on Soundblaster card ?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-02-11 15:56:39 UTC
From: khopper@kimbark.uchicago.edu
Message-ID: <1994Feb11.155639.10723@midway.uchicago.edu>
Source record: 50222

I just read the latest issue of 73 mag. It features WEFAX as a fun-to-copy mode. Looks great, but the prices of the receiving modems are outrageous ($600!). I flipped on my Radio Shack Scanner and at 3:47a.m. it started beeping away (XYL not too pleased :-) as one of the "birds" passed over Chicago.

It looks like the Soundblaster (or clone of SB) would be a NATURAL receiving board for the WEFAX sigs. What do you think ? has it been done yet ? John Langner, WB2OSZ, author of the Pasokon SSTV board was contemplating WEFAX as an add-on, but with the advent of affordable DSP cards maybe this the SB is a better idea ?

428. Need info on PI card

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-02-11 19:26:09 UTC
From: kris_nosack@byu.edu
Message-ID: <9#&@byu.edu>
Source record: 50223

I've been reading this group for some time and remember reading several posts a while back concerning the PI card that supports 56k baud async AND a 9600 baud capable port.

This card is just what we need for our packet gateway! We will use the 56k baud async port to connect us to the Internet feed while we hope to use the 9600 baud port for a 9600 baud packet port. Obviously we will be running NOS as the software for the gateway.

Therefore, I would like to know if the PI card will do this?
I would appreciate receiving any information relative to the PI card.

Thanks!

: future. I have looked at the MFJ 1278B and like what I see. Also, a friend
: suggested the Kantronics KAM. Which do you think would be better. This is
: to use with a Realistic HTX-202 2 meter FM HT. Or is there another one
: you like better?

Whoa - looks like we have a major problem here.
First, if you plan to use ONLY your 2M FM HT, you are wasting a lot of time
and MONEY looking at a Multi-Mode Controller. You will NOT be able to use
the wide range of features in the MMC with just your HT. Virtually ANY
1200bps TNC (TNC-2 type) will be all that you need.

The MMCs like KAM and MFJ-1278 etc rally shine on the HF bands. I have and
use BOTH the KAM and MFJ-1278T as well as a pocket TNC for portable use.
If you want to do the SSTV and FAX modes, the MFJ-1278 is the way to go.
I personally prefer the KAM these days because I want and need the dual
port capability. I want to be connected to the DX PacketCluster on VHF at
the same time that I am on CW, FSK, etc on HF. The MFJ-1278 does not
have the dual-port function. I frankly have a quite a bit more invested
in my MFJ-1278T (w/extra ram and 9600bps modem, host mode s/w, etc) but
for ANYONE interested in DXing and using PacketCluster - the KAM is the
ONLY way to go - IMHO.

What you should really take with you is an HF radio and an AMTOR or CLOVER
interface board for your computer. Then you will will seldom be out of
range of a BBS.

While this would be a nice feature, and just about require
digital transmission, it is illegal to encrypt amateur traffic. While
this may change in the future, it is one of those hard and strict rules
that is here today(ie. This isn't like ordering pizza over an
autopatch). You would be better off with Spread Spectrum, since it is
legal, and no one would (probably) even know you were there.

Good Luck,

434. Yaesu FT-470 RX Range?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-02-12 22:38:42 UTC
From: kbrune@vern.bga.com
Message-ID: <2jjlpi$k7s@giga.bga.com>
Source record: 50229

I recently acquired a FT-470 Yaesu radio. I opened it up turned it on an pushed a few buttons and tunned it in to 162.40MHz to hear the local weather radio station. I then set this freq as memory #1. After this I turned it off and let the battery charge. After charging I decided to clear the memory and start fresh. Well, after doing this, for the life of me I could not tune that thing above 148.00 MHz on the low band setting. I think this is some kind of undocumented feature. Anybody have any ideas? thanks

Ken WL7IR

435. 30 meter "Band Plan"

The allocation in the UK (at least) is

10.100 - 10.140 CW
10.140 - 10.150 Digimodes

However there is a side note that unattended digimodes should not be used on
this band

I am prepared to respond to any specific comments you may have on the
219 Committee report.

I do not wish to address your personal attack on Jim Fortney other than to
assure that I prepared the drafts of the reports based upon the discussion
conducted by the Committee Jan 7-9 in Cleveland. Jim did critique
the draft, as did all members of the Committee.

The Band Plan and other remarks represent the collect thought of our
Committee at that point in time. Based upon further data, particularly
investigations underway to assure that the technical objectives are
appropriate, it may be that there will be some changes the will be
incorporated into the final report.

You, or any other reader, are welcome to provide input into this process.

Tod Olson, K0TO

444. PktWin V2.0 Bug (Oops)

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-02-14 10:40:32 UTC
From: ssrhouns@csug.cs.reading.ac.uk
Message-ID: <CL7MzL.8r6@csug.cs.reading.ac.uk>
Source record: 50239

I have had a couple of reports of a bug in PktWin V2.0, sorry.
It seems that the connect dialogue box resets the port to
COM1:. I shall issue V2.1 as soon as I can re-install BC++
V3.1 (it will be quicker than converting to V4.0). If there
are any other problems/suggestions please, please, please, let
me know and I will try to incorporate them into this interim
release.

Thanks very much for all the feedback, the response has been great :)

RWM

Howdy:

In a recent spate of messages, we have been told of the capabilities
of the hamblaster. It sounds rudimentary so far but I am sure that
over time the capabilities (new software development) will proceed
and its capabilities will be enhanced and it will make a very
interesting tool for amateur radio communications, experimentation,
and learning DSP. There will be alternatives as you will now be told.

JWA

For future expansion, the Hamblaster has an expansion connector.
Several add-ons will include, a better A/D-D/A, Packet switch,
real time tuning scope display driver and a microprocessor.

RWM

In other messages, John Alberts has told us of the lack of capabilities
of the Sound Blaster 16 with ASP. He is WRONG.

JWA

Not really, because I own one, I was refering to the
Soundblaster Pro. Any referances to the ASP version
was based on information from the "Ultimate Soundblaster
Book" that I purchased from a local book store. I was
unaware and the book didn't mention it's programming
capabilities. I believe my actual words where
"Im not shure but" .

RWM

I received my Sound Blaster developers kit via UPS yesterday at
last. It is easy to see how John could have made the mistake
he made. The manuals received in the kit describe two distinct

pieces of processing hardware. One is called the DSP and the
other is the ASP.

The DSP has all the limitations mentioned by John in his statements
concerning the capabilities of the Sound Blaster card (or lack thereof).
It is a proprietary gate array surrounding masks from other chip
developers to do stuff like DMA blocks of samples in and out, to convert PCM
to u-LAW, 2 or 4 bit ADPCM, CVSD, etc. It directs the flow of
MIDI commands, etc. It is a pretty neat thing in and of itself
but it is NOT what we want. We want a full blown DSP chip, with
a modified Harvard architecture and at least 16 by 16 bit -> 32 multiply,
accumulate, read new coefficient and data in one instruction time.
THE ASP is a real DSP chip and has all this. It is 512 words of off
chip program memory, 512 words of off chip data ram, 192 words of X RAM
on chip,128 words of Y ram on chip.

JWA

The Hamblaster comes with 32K of program/data memory.
It will be expandable to 32k of program and 32k of data
memory with a total os 64k words. More than you'll ever need!

Our packet modem software is 3K. It just won't fit in the
Soundblaster ASP 16.

X ram is program and sample data, Y RAM would be used for
filter coefficients. THIS IS A FULL BLOWN DSP CHIP. It
does NOT have the limitations John has told us the hamblaster
overcomes.

Indeed, on the A/D, D/A front, it is quite clear that the under
$300 SB16-ASP is quite a bit MORE CAPABLE than hamblaster.

JWA

New information places the Hamblaster at about $275.00

RWM

It has two channels (16 bits each), D/A, and A/D.
The sample rate is completely controllable by uploading a divisor to
the control register. The lowest available rate is 5 Khz and the
highest is 44.1 Khz. The processor runs at 12 MIPS so filters would
execute at around 25 MIPS. This is because it has the typical DSP
feature of multiply two numbers, read the next two, and accumulate the
last result while shifting the pointers in two instruction times.

JWA

That's great for HiFi work but for Ham use you only need an
8kHz sample rate and an 8 bit D/A-A/D. If you consider pipe-
lining the C25 also about runs 25 MIPS.

RWM

That is plenty fast. I will be able to do dual channel modems for this card. Since the thing does not also have a UART, or SIO, we will have to the HDLC and UART functions on the chip when required. Other DSP developers have done this all on chip (Finland DSP development group on the Motorola DSP56001). We will be able to do a lot.

John should be more careful when he makes flat statements about commercially available products. If he were a `real competitor' of Creative Labs, he could get into a bit of a hassle.

JWA

There's no way that a product made for Ham Radio will compete with a product that will sell in the millions. In the Ham market there just aren't enough sales to generate a reasonable profit! You'll never get rich selling to Hams.

RWM

I told John in a reply to his mail that I doubted the accuracy of his statements on the Sound Blaster16 with ASP. I was correct.

JWA

Not really. Because of the proprietary nature, I can't disclose the full picture. When it's released, A complete package update will be available.

RWM

The Sound Blaster 16 with ASP is available from many places for under $300. The developers kit is $99, available only from Creative Labs.

I think the Hamblaster's price will be competative! They will offer help to third party programmers.

I will be writing programs for the ASP and giving them away on your favorite ftp sites and through the ARRL download request service. These programs will be the basis of articles for QEX describing the algorithms and the operation of the sound blaster card in amateur radio applications. Phil Karn has devised a new link layer for packet, with FEC, etc. and I will be providing modems that use the ASP. I believe I can provide what the latest hamblaster announcements state and more in short order after I get the assembler for the ASP. I will do this as quickly as possible. I am a bit miffed that I stopped developing the Windows and DOS front ends and display stuff for the SB16 ASP after John's note because I thought the SB16 was too limited. Now it is full steam ahead.

JWA

Good Luck!

Programs for the Hamblaster will also be available on public domain disk or BBS's.

At the moment, I know of two under development - G7IUB is developing one to run under WAMPES (a bad idea, IMHO) and I'm (slowly) working on some form of BBS for Linux using the kernel AX25. This may be some time though :-)
In the immediate term, the Linux port of WG7J's JNOS (by KF8NH) works real nice - I used to run it myself.

> transmit audio level out of the TNC is way too low.

It may not be the audio from the TNC -- the 5100's data connection port has been changed recently. I own two 5100's -- one is a year old and one is a month old. The "old" 5100 works perfectly well with the TNC wired into the data port on the back of the radio. The "new" 5100 keys up the transmitter but doesn't provide any audio output when it transmits.

I called Yaesu about this and it seems that they've changed the data port on the back of the radio to allow direct 9600 baud connection. In doing this, they made it impossible to run 1200 and 2400 baud packet through the data port. Wiring directly to the mike connector does still work, so that's the "correct" way to do it now. The manuals haven't been updated to reflect the new hardware yet.

Bummer. Now I've got two "identical" radios and two distinctly different ways to plug in a TNC.

There's a "keyboard mod" that will allow you to receive out-of-band on
UHF. It is a bit cumbersome but it works well up to about 460 MHz or
so.

***

For those looking for an extended UHF receive mod for the Yaesu FT-470
handie-talkie, here it is!

Found this on packet this afternoon and after trying it out on my
FT-470, it works great!

(Edited for line length limit)

---- cut here ----

Msg#:1665 Lines:67 Date: 7/19/91 1:24 am
From: KD6CQ (via Packet)
To: FT470 @ ALLUS
Re: Yaesu FT-470 Extended RX Mod!!!

R:910719/0518z @:N6YN.#SOCA.CA.USA.NA Los Angeles #:49014 O:KD6CQ
$:49014_N6YN

Thanks to Darrel Sego (KM9S) and INFO-HAMS for the basis of this
mod. This modification require NO TOOLS and will allow your Yaesu
FT-470 to RECEIVE from 400.00 MHz to 500.00 MHz. Transmit is
intact only from 430.000 to 450.00 MHz.

Modification Follows:

YAESU FT-470 UHF RECEIVE MODIFICATION.

This modification will make the poular Yaesu FT-470 dual-band
handheld transceiver receive below 430 MHz and above 450MHz. This
procedure stores the upper limit into the "U" memory channel and
the lower limit into the "L" memory. To use it return to the "L"
memory and tune up to the frequency desired or direct keypad
entry (example 460.075, enter 60.075). Once the frequency is
entered you may store it into any memory according to the
operating instruction manual. NOTE: do not invoke memory skip in

either the "U" or the "L" memory.

Here are the steps in order.

1. Place the radio on the UHF band and program into VFO A 450.00 MHz simplex (no offset).

2. Press the F and then the RPT key.

3. Enter 0000 into the keypad.

4. Shut the transceiver off then back on.

5. Press the repeat key twice for a + (plus) offset.

6. Press the REV button one time.

7. The radio will now display 1450 MHz. (the radio won't operate at these frequencies).

8. Press the F key and the down arrow until the unit displays 500.00 MHz. Press the F key twice to store in the "U" memory.

9. Repeat steps 1 through 4.

10. Press the repeat key for a - (minus) offset.

11. press the REV button once.

12. Key the PTT button 3 times. The display should show 45 MHz.

13. Press the F key and the UP arrow until the unit displays 400.00 MHz. Press the F key once and rotate the knob on top until the unit displays "L" memory. Press the F key twice to store into the "L" memory.

ANY frequency can be either dialed in, scanned, or keyed in. Store your favorite frequncies in any memory.

Variations on frequency limits can be used. Sensitivity is useable at 506 with severe degradation over the spec.

Have fun!!

Scott KD6CQ

---- cut here ----

I did the above and plugged in 483.2125 (L.A. County Sheriff, East Los Angeles) and with my Pro-34 scanner as a check radio, I was able to receive there. However, during step 12, my display said "50" instead of the stated "45".

One thing that the mod does not mention that by entering in 0000 during step 3 (modifying the repeater split), it only affects VFO A. After you've made the keyboard mod, you can reset the repeater split for VFO A (if you don't and you enter a 440 frequency with either a -/+ offset,

you won't be offset! It will remain at 0.00 offset).

Caution: If you don't have the automatic repeater offset option ON, the repeater offset will remain active when you do the above steps. And the repeater offset indicator remains active in the L/U memories. If you follow the above instructions to dial in the extended UHF frequency and save it to one of the memory channels, the offset is also saved. And if you press the PTT, in addition to the "Err" message, your frequency display for that memory channel becomes scrambled (but the frequency itself is not changed). My recommendation either is to remove the offset after you've saved the extended UHF freq. into memory or turn ON the APO.

and rec.radio.swap newsgroups. It is intended to serve as a guide for the new
reader on what to find where. Questions and comments may be directed to the
author, Jay Maynard, K5ZC, by Internet electronic mail at
jmaynard@oac.hsc.uth.tmc.edu. This message was last changed on 18 September
1993 to add the mailing lists for the new rec.radio.amateur newsgroups, to
note the rmgroup of rec.radio.amateur.packet, and to officially retire some
(in)famous threads of discussion on rec.radio.amateur.policy.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list
for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions
were held on the mailing list, and sent to the mailboxes of those who had
signed up for it. When the Usenet software was created, and net news as we
now know it was developed, a newsgroup was created for hams: net.ham-radio.
The mailing list and the newsgroup were gatewayed together, eventually.

As the net grew, and as packet radio came into vogue, packet discussion began
to dominate other topics in the group and on the list. This resulted in the
logical solution: a group was created to hold the packet discussion, and
another corresponding mailing list was created as well: net.ham-radio.packet
and PACKET-RADIO, respectively.

These two groups served for several years, and went through Usenet's Great
Renaming essentially unchanged, moving from net.ham-radio[.packet] to
rec.ham-radio[.packet]. Readership and volume grew with the rest of the
network.

The INFO-HAMS mailing list was originally run from a US Army computer at
White Sands Missile Range, SIMTEL20. There were few problems with this
arrangement, but one was that the system was not supposed to be used for
commercial purposes. Since one of hams' favorite pastimes is swapping
gear, it was natural for hams to post messages about equipment for sale
to INFO-HAMS/rec.ham-radio. This ran afoul of SIMTEL20's no-commercial-use
restriction, and after some argument, a group was created specifically
```

for messages like that: rec.ham-radio.swap. This group wasn't gatewayed to a mailing list, thus avoiding problems.

While all this was happening, other folks wanted to discuss other aspects of the world of radio than the personal communications services. Those folks created the rec.radio.shortwave and rec.radio.noncomm newsgroups, and established the precedent of the rec.radio.* hierarchy, which in turn reflected Usenet's overall trend toward a hierarchical name structure.

The debate between proponents of a no-code ham radio license and its opponents grew fierce and voluminous in late 1989 and 1990. Eventually, both sides grew weary of the debate, and those who had not been involved even more so. A proposal for a newsgroup dedicated to licensing issues failed. A later proposal was made for a group that would cover the many recurring legal issues discussions. During discussion of the latter proposal, it became clear that it would be desirable to fit the ham radio groups under the rec.radio.* hierarchy. A full-blown reorganization was passed by Usenet voters in January 1991, leading to the overall structure we now use.

After the reorganization, more and more regular information postings began to appear, and were spread out across the various groups in rec.radio.*. Taking the successful example of the news.answers group, where informational postings from across the net are sent, the group rec.radio.info was created in December, 1992, with Mark Salyzyn, VE6MGS, initially serving as moderator.

In January, 1993, many users started complaining about the volume in rec.radio.amateur.misc. This led to a discussion about a second reorganization, which sparked the creation of a mailing list by Ian Kluft, KD6EUI. This list, which was eventually joined by many of the most prolific posters to the ham radio groups, came up with a proposal to add 11 groups to the rec.radio.amateur hierarchy in April 1993. The subsequent vote, held in May and early June, approved the creation of five groups: rec.radio.amateur.digital.misc (to replace .packet), .equipment, .homebrew, .antenna, and .space.

The Current Groups

I can hear you asking, "OK, so this is all neat history, but what does it have to do with me now?" The answer is that the history of each group has a direct bearing on what the group is used for, and what's considered appropriate where.

The easy one is rec.radio.amateur.misc. It is what rec.ham-radio was renamed to during the reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize

this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, should be removed by September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is now rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there.

The first reorganization added two groups to the list, one of which is rec.radio.amateur.policy. This group was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The other added group is rec.radio.cb. This is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently Mark Salyzyn, VE6MGS. The email address for submissions to the group is rec-radio-info@ve6mgs.ampr.ab.ca. Inquires and other administrivia should be directed to rec-radio-request@ve6mgs.ampr.ab.ca. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas,

commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

458. My HAMBLASTER note

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-02-15 12:55:30 UTC
From: n4hy@growler.ccr-p.ida.org
Message-ID: <N4HY.94Feb15125530@growler.ccr-p.ida.org>
Source record: 50262

The response to my note on the Soundblaster and Hamblaster cards has been overwhelming. The notes number in the hundred. I had no idea there was so much interest. I cannot possibly hope to answer all of these notes and I hope you will accept my apologies for not doing so.

I will keep the news groups posted as to what becomes available when.

Bob

I'm sure there will be a few responses to your request, but, without
offending,
I would suggest that you re-send your request to the rec.radio.scanner
group.
They seem to have almost infinite expertise in restoring or increasing
frequency
ranges of scanners through various modifications. If the amateur community
could
focus those folks more on the productive aspects of radio instead of
eavesdropping illegally, we would see a sizeable growth in the energy level
out
toward amateur radio operations worldwide!

I hope I'm not missing something here, but as I mailed to the original poster (postor??) I have been using 1200b through the data jack on the back of the 5100 with my 1278 for close to a year now. Constructing the cable with the instructions in the manual was straightforward, and I've had no problems save some deviation adjustments when I originally set it up.

The thing I don't understand about Yaesu's reply is, what does the data rate have to do with audio level and where it is fed??

1200 baud (and the uncommon 2400 baud) are audio modulation modes. 1200 baud is AFSK (Bell 202) and 2400 baud is APSK (don't recall the standard offhand). The audio modes are, by convention, pre-emphasized on transmit and de-emphasized on receive. This makes the audio packet (1200/2400) compatible with phase-modulated radios in addition to the (now common) direct FM PLL radios.

9600 baud is sent as a direct FSK mode; the data actually directly shifts the carrier. A phase modulated radio is not really useful for this since it is not capable of transmitting a DC FM signal. By convention, 9600 baud modulation is "flat", i.e., not pre-emphasized on transmit and not de-emphasized on receive. The challenge to hooking up a 9600 baud modem to a radio is finding the flat audio in/out points. Some radios provide this on a connector.

This note is brief; if anyone would like further explanation, please drop me a note.

In article 106450001@hpcss01.cup.hp.com, markb@hpcss01.cup.hp.com (Mark Butterworth) writes:
>Yes, I am using N0ARY-1 here in california, send him an internet
>Email message and get set up on his machine(s), SUN SPARK II,
>quite a setup.
>
>try sending to root@bbs.arasmith.com

Please don't use this address. Anything to @bbs.arasmith.com requires that you already be registered or a bounce message will be sent back to you. Here are the proper addresses:

gateway_info@arasmith.com
will automatically send you gateway instructions. These are about 10Kb and tell you how to operate the gateway from both directions.

gateway_request@arasmith.com
This is the address to send in a registration request. You must include fullname, call, city/state, zip and a phone number. It normally takes me a few hours to get you registered, it is a manual verification process. You will be notified when the registration is complete.

bob@arasmith.com
This is my address, use it when you have problems.

There is a mirror image of my setup located in Fremont CA, just across the bay. The sysop there is Pat. His addresses are:

gateway_info@lbc.com
gateway_request@lbc.com
pat@lbc.com

I also have bbss coming up in other areas of the US. I don't know whether or not they will allow unlimited access of their gateways. I would imagine they will post here if so.

>his gateway this week has been having some trouble. If you can't get
>on let me know.

The gateway is running ok, the problem is that a week ago I lost my gateway authentication file. The one I recovered from tape was a little out-of-date. This caused some users to disappear. If you are having problems with the gateway please send me a message.

I will append the gateway instructions to this message to save you having to request them via mail.

In addition, there has been recent requests for a bbs that runs on a Sun. My bbs does run on Suns. It was developed on a 3/80 but now resides on my network of sparcs. Since the bbs makes heavy use of network sockets it doesn't have to reside on a single machine although most people run it that way. The code has also been ported to HP workstations and 386/486s running linux. The HP and linux ports where done by Bob Proulx, KF0UW, in Colorado. For info on these ports try contacting him directly at rwp@hprwp.fc.hp.com

I have just went through a major upgrade in my code and will not have it available for ftp until it has been throughly tested. This activity is in progress. I will try to make an announcement when it is available. To get more information about the bbs and how it functions in a unix environment ftp the file arasmith.com:/pub/n0ary.bbs/Architecture.ps.Z. When the bbs becomes available it will be ftp'able from that same location.

Any other questions, just yell.

Bob Arasmith
bob@hal.com (work)
bob@arasmith.com (home)
n0ary@n0ary.#nocal.ca.usa.na (packet)

There is an error in the "73" magazine article. If you are an internet only user the action of registering you automatically enables email forwarding. You do not need to perform the "Enabling" step.

N0ARY/BBS Internet Gateway Operating Instructions
August 7, 1992

LOCAL USERS:

Local users are those that log into the bbs via the bbs's telephone modem port (408-749-1950) or via one of the 3 tnc ports (144.93, 223.62, 433.37). Each local user has a bbs account that is used to customize how the bbs interacts with the user.

Local users can set their account up so that all incoming mail addressed to their call will be forwarded via a gateway to internet and on to other networks (mcimail, compuserve, etc). All the user needs to do is enter his email address and turn the feature on.

EMAIL bob@hal.com
EMAIL ON

When the EMAIL feature is turned on the packet message will be deleted at the time of forwarding through the gateway. So care should be taken that the paths are correct prior to turning the feature on, for instance enable it, send a test message, and disable it. After a successful transfer re-enable the feature. To disable the auto forwarding feature simply type:

EMAIL OFF

Messages can be sent by packet users to the internet users via the gateway.
This applies to users at N0ARY as well as users at other bbs's. Begin by
sending a message to IPGATE@N0ARY with the first line of the message being
the letters "To:" followed by the internet address of the recipient.

N6ZFJ de N0ARY >
sp ipgate@n0ary
Enter your subject:
Meeting?
Enter your message body:
To: bob@hal.com
Are you planning to attend the club meeting on Thursday? Give me
a call. 73, Connie
^Z

NOTE: That the recipient cannot respond to the message unless they
are a ham and registered with the gateway. He/she becomes registered by
sending a message from his internet host to gateway-request@arasmith.com.

REMOTE USERS:

Remote users are those that do not log into N0ARY directly but merely
appear from the packet world to use it as home. If a packet user checks
the "White Pages" for a remote user the entry comes back as @N0ARY.
The packet user then address his message to YOURCALL@N0ARY and the
bbs will do the translation and forwarding to internet.

It is not necessary for a person to know your actual internet address
nor use the SP IPGATE method described above. From the packet network
it appears that you are just another user at N0ARY.

WHITE PAGES:

The "White Pages" is a distributed database of all the bbs users. Most
bbs users in the US are represented in the database as well as many from
other countries. When a user chooses a home bbs, that bbs generates
an update that is sent to the regional servers and then distributed to
all the other bbs's. An entry consists of; call, home bbs, first name,
zip, city and state. When a user wishes to send another packet user
a message he/she consults the white pages (WP) for the home bbs.

REGISTERING:

Before a user, both local and remote, can send a message from internet
into the bbs system he/she must register with the gateway. This is done
by sending a message from the host that he/she intends to use to
gateway-request@arasmith.com with the following information:

CALL:
FIRST NAME:
CITY & ST:
ZIP:

When a request is received the "From" field is copied directly into
a file with the requesters call. Whenever the gateway receives a message
bound for packet it scans this file comparing on the "From" field. When a
match is found the gateway uses the associated call from then on. If
there is no match the mailer bounces the message with a one-liner
indicating the the user must register.

If you currently use another bbs as home this needs to be stated
in the request. Otherwise you will be assigned N0ARY as your home.
If you choose not to use N0ARY as your home you must make sure
people know to send your message to YOURCALL@N0ARY to pass through
the gate. Your WP entry will be wrong.

EXECUTING BBS COMMANDS REMOTELY:

Many of the commands available to local users is also available to
remote users by sending a message to the bbs. Here is a subset of
the commands currently available.

LIST listing messages
LOOKUP look up calls in the on-line callbook
WHO call dump a users account information
READ read messages and files
USERS n display the last n users to connect to the bbs
INFO display manual pages of various topics
CD change directories in the file system
LS/DIR display the contents of a directory
WP call look a user up in the "White Pages"
HELP get help on how to use a command

Not all commands available to local users can be accessed via the
gate. All interactive commands are disabled as well as commands
that modify the users account.

The command parser for the bbs is very powerful and the user can
form very complex requests. For instance the following command
is valid on the bbs:

LIST LAST 20 BULLETINS FROM N0ARY
LIST ALL BULLETINS ABOUT KENWOOD

The ABOUT keyword is used to search the subjects of messages for a
given pattern, in this case KENWOOD. It can appear anywhere in the
subject line.

This is an example of how complex all the commands can become. They
can also be abbreviated down to the level understood my most other
bbs programs. Any of the following will give the same results.

L< N6ZFJ
LIST FROM N6ZFJ
LIS < N6ZFJ
L FR N6ZFJ

In most cases a minimum number of unique characters is needed to
distinguish a command.

You can get a list of commands and a translation chart from W0RLI
to N0ARY by typing the following commands.

INFO COMMANDS
INFO W0RLI

Other commands that you may wish to execute are:

INFO MANUAL
HELP HELP
HELP LIST

Now that you know what some of the commands are this is how you go
about executing them. You send a message to cmd@bbs.arasmith.com
with your commands entered one per line or separated by semicolons.
For example if you want to know if three of your buddies are in
the white pages and if the bbs has any messages about the ICOM W2A.

Send to:
cmd@bbs.arasmith.com

Subject: you can put anything here
wp n0ary n6zfj n6une
list all about w2a
.

The bbs will execute the commands and respond to you via return mail.

SENDING MAIL TO PACKET:

Once registered the user is free to begin using the gateway to send
messages from his host through the gateway into the packet world.
How much you have to specify of a users address depends on how much
the bbs already knows about the user.

If the bbs knows the home bbs of the user and his home bbs is know to
the the N0ARY bbs, which most of them are, you simply need to supply
the call.

n6zjf@bbs.arasmith.com

If the N0ARY bbs doesn't know of the user but does know where his
home bbs is then you need to supply just the home bbs call in
addition to the users.

n6zjf%n6qmy@bbs.arasmith.com

Notice that the call and home bbs are separated by a percent sign '%'
rather then the '@' which is used in the packet domain. This is because
the '@' has a meaning in the internet address.

If the bbs has no knowledge of either the user or his home bbs then
you probably have the wrong home bbs or it is a new bbs. In which

case you will have to supply the full address so the bbs will know
how to route the message.

n6zfj%n6qmy.#nocal.ca.usa.na@bbs.arasmith.com

This level of addressing is hardly ever needed and normally means that
the home bbs is in error.

Bulletins can be sent in a similar fashion. The address is made up
of a keyword, which can be any six character word and a distribution.
Distributions are local to an area. For instance SBAY is valid in
northern CA, it probably has no meaning at all in Topeka, KS.

Valid distributions are:
ALLUS please avoid this one
ALLUSW all western US
ALLCA all California, any 2 letter state should work

So if you trying to find a cw filter for a Kenwood TS440.

Send to:
want%allca@bbs.arasmith.com

Subject: Kenwood TS440, CW filter
If you have one of these you are willing to part with please
give me a call or leave message, thanks.
73, N6ZFJ@N0ARY.#NOCAL.CA.USA.NA
.

Be descriptive, brief, and always include your full return address in
the message. Also please try to limit your distributions to small
regions. Using the ALLUS distribution really slows down the flow of
messages.

INFO ON THE N0ARY BBS:

The bbs came into being in July of 1990 and as of July of 1992 had
over 1000 users, 800 registered as home. The bbs has 3 rf ports, 2
phone ports, the internet port, and a voice synthesizer port. The
latter allows users to check for messages via DTMF from their handhelds.

The bbs itself runs on a Sun workstation under Unix. The code was
written by Bob Arasmith to focus on the user. Great care was taken
to make the bbs very forgiving to the novice user but very flexible
and powerful for the old-timer. The bbs can be configured to interact
with each user differently. Some examples are:

* List messages in either descending or ascending order.

* Specify a list of keywords that the user wishes not to see displayed
when a list is performed, similar to a kill file.

* .signature and .vacation files.

* Specify how many lines the users terminal is capable of displaying before scrolling, the bbs will feed info this many lines and pause allowing the user to catch up and continue or abort the operation. Similar to more.

* Users can put commonly executed commands in keystroke macros that are accessible via a single keystroke.

A manual is currently available describing the commands and their permutations. This manual will be available in late 1992 as a postscript file. Run the command INFO MANUAL to learn how to get one via the post office. It is not available in an ascii format.

If you have any questions about the internet gateway or the bbs in general please drop me a message.

463. Re: Packet BBS run off of a SUN?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-02-15 16:54:35 UTC
From: bob@arasmith.com
Message-ID: <2jquob$hr9@hal.com>
Source record: 50257

My bbs does run on a Sun as well as HP workstations and 386/486 boxes running linux. The latter two ports where done by Bob Proulx, KF0UW, in Colorado. You can contact Bob at rwp@hprwp.fc.hp.com if you want to know the particulars about these architectures.

I have made rather major changes to my code recently and have the current version in test. It will be available for ftp when the testing is complete and it is running at my neighboring sites. There are currently 5 bbss running the earlier version of this code. For info on what it is like to run the code try contacting one of the following individuals:

pat@lbc.com (Pat Mulrooney, N6QMY)
owen@DeLong.SJ.CA.US (Owen DeLong, KB6MER)
rwp@hprwp.fc.hp.com (Bob Proulx, KF0UW)

Many of our users monitor this newsgroup so you can question the users directly.

I do have a document that kind of describes the structure of the bbs, how the process interact, etc. You can ftp this document from:

arasmith.com:/pub/n0ary.bbs/Architecture.ps.Z

If you have questions after reading this doc please send me a note. When the latest version of the bbs is read it will be available for ftp in that same location.

464. Hamblaster Update

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-02-15 18:41:31 UTC
From: jwa@tellabs.com
Message-ID: <1994Feb15.184131.5901@tellab5.tellabs.com>
Source record: 50258

2-15-94

I hope that this will clear up a few questions about
the Hamblaster.

Several weeks ago I mentioned that the projected cost for
the board would be about $350.00. Well, it was just a
"guesstimate"! It appears that it will be more in the $275.00
range and could be as low as $250.00. This may still sound
high compared to the Soundblaster or other sound cards, but
you have to remember that it's made exclusivly for Ham Radio.
Willco may only sell a few hundred a month. They can't compete
with companies that sell over a million units a year.

The Hamblaster is not a software package. It requires a
special sound card that uses a Texas Instruments TMS320C25
DSP to run filters or audio demodulators. It can interface
to a TNC via a TTL digital port and replace the TNC's poor
filtering.

It's not compatible with other sound cards and it can
co-exist with them. I use my Soundblaster Pro and Hamblaster
together. I can, for example, run a filter on the the Hamblaster,
connect it's output the Soundblaster and record a CW signal using
the SB software under the Windows environment.

More "info"

1) External Power supply

I think one feature that separates the Hamblaster
from other sound boards is it's ability to run on
an external 12 volt supply. When a filter or modem
is loaded, you can turn off the computer and it
will stay active.

When it's connected to a PK-232, there's no need
to leave the computer on in order to keep the DSP
alive. Right now, my PK232/Hamblaster is runing
and it's been operating for about two weeks.

There still some developement work being done and
I'm told that the power supply will be on a small
PC board and sold as an option for about $20.00.

2) Adaptive (LMS) filter

There's ongoing developement in this area. We are
planing (I don't think this has been done before)
to add controls to the LMS algorithm.

3) Soundblaster incompatibility

As I said before,
The Hamblaster IS NOT soundblaster compatible.
It was designed that way so that it will run
independant of other sound boards. I can still
use my Soundblater to record sound, play music,
load software from the CD or use the MIDI interface.

Source record: 50260

Use the DJ8JV software. You can build your interface for only about $10. It consists of a 741 op-amp, some r'c some c's and 4 diodes. Normal audio goes via this interface to your pc running the software. you can watch nice wx charts, satellite pictures and even slow scan tv pictures in color. To be able to transmit you have to add some components for another say $2
You can download the software from various ham bbs'es.
Succes,

Dick Hissink PA3DSP

469. Aleph Null DSP-4 (was: HAMBLASTER ...)

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-02-16 08:16:00 UTC
From: smattila@metz.une.edu.au
Message-ID: <3418@grivel.une.edu.au>
Source record: 50264

The DSP project in Finland, known as Aleph Null has produced four versions of Motorola 56001 based cards. I have older version DSP-3. It is good at handling speech quality signals. The new version DSP-4 can handle two simultaneus channels (stereo) up to 24 kHz. I don't remember if there is a lower limit, I suppose it goes down to DC. The card uses state-of-the-art DAT codec, which keeps its price relatively low (something around US$500). The DSP-3 was not easy to build, neither is DSP-4. Building it needs experience and patience, oscilloscope is almost a must.

DSP-4 is connected to PC or other computer via RS-232 interface. The special feature of it, two similar channels, which can be phase-synchronised, makes it possible to build IQ-receivers or tranceivers and modems requiring IQ (phase and quadrature) techniques.

There is a mailing list for Aleph Null DSP-4: dsp4-request@nic.funet.fi (dsp4@nic.funet.fi).

Would you be kind enough to either post or E-mail me the complete address
for the ftp site where you've posted the update? I'm not familiar enough
with all the servers to "fill in the blanks". Thanks!

475. Packet at 1.2 GHz (23cm)?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-02-16 20:01:41 UTC
From: val@cs.weber.edu
Message-ID: <2jtu35$npg@u.cc.utah.edu>
Source record: 50270

What little I know about the 23cm band is from a recent article (from
a few months ago) in QST.

1 - It takes a Gunplexer.

2 - Since the receiver oscillator is derrived from the transmitter,
it is a full-duplex path (on a frequency pair).

However, I haven't found anyone in my area who is currently doing anything
on the 23cm band. I haven't found anyone who has done digital communication
on this band.

I'm wondering what is necessary to get packet up and running on this band.
(Don't worry about anyone on the band. If I go to 23cm, I know someone
else who will go there too.)

As an example of what kind of information I'm looking for in the 23cm band,
I'll give the equivalent information for my current packet setup.

```
RS-232 User-
serial built
Computer <------> TNC <------> 2m radio <--[Duplexer]--------> Antenna
^---------> 70cm radio<--|
```

And the template for 1.2GHz digital would be:

```
????? 50 (?) ohm
cable cable
Computer <-------> ????? <----------> Gunplexer
^
+12v-----|
```

Since there will be few responses to this posting, I think that it would be
best to use followup articles.

Thanks.

What you need to do, is put your MFJ into KISS mode and change the
konfig.ac file to KISS.drv ! As simple as that !

Works very good with my MFJ 1274...

I am an packet user in the UK, and i read a bulletin from another UK
amateur whos name and callsign i have forgotten, who was talking about
the new version of baycom. He is the chap that translated the manual
and the software of the past versions.

Anyway he was saying that a new version of baycom is about to be released
very shortly, but its not out yet.

As soon as i hear anymore i will post an article here, that is if no one
else has before me.

490. Q: Easy Mobile Packet?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-02-17 20:00:18 UTC
From: Daniel.W.Collison@dartmouth.edu
Message-ID: <2k0icj$b8c@dartvax.dartmouth.edu>
Source record: 50285

Anyone have any advice for a convenient way to connect a packet TNC to a mobile rig? It would be nice not to have to keep unplugging from the external speaker jack, not have to unscrew the microphone, etc., if you could switch from mike to packet & vice versa. Also it would be convenient to run the TNC off of the car's power. I want to use a KPC-3 TNC, an Icom 228H, and a laptop computer. Thanks.

491. Analog WEFAX pictures with SoundBlaster

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-02-17 21:06:36 UTC
From: smattila@metz.une.edu.au
Message-ID: <3426@grivel.une.edu.au>
Source record: 50286

Newsgroups: rec.radio.amateur.digital.misc
Subject: WEFAX with Soundblaster card ... some pointers
References: <1994Feb11.155639.10723@midway.uchicago.edu>
Organization: University of New England, Armidale, Australia

It would be relatively easy to program SoundBlaster to receive analog
WEFAX pictures on 137 MHz and 1.7 GHz, with proper receiver, of course.
WEFAX information is transmitted with FM modulation with 50 kHz bandwidth.
The picture information in audio signal is one sideband modulated on
2400 Hz carrier. For best picture quality, demodulation should be
synchronised to the 2400 Hz audio carrier, that is difficult with
SoundBlaster.

Unsynchronised demodulation causes (pseudo)random noise or artifacts
in the picture. I have seen a solution to this problem: 1. oversample
signal (maybe 9600 samples per second), 2. remove sign, ie. rectify
the signal, 3. average (four samples if 9600 samples per second) and
4. the averaged values are pixel values. Line synchronisation is best
done after averaging.

The theoretical resolution of analog pictures is something like 800 x
800 pixels, picture with 400 x 400 pixels looks good, even 250 x 250
is usefull. Eight bits per pixel will more than enought for satellite
pictures.

One problem we had while using the old German digital WEFAX system
(UKW Berichte / VHF Communications, late 1970's) was the electrical
noise from digital circuits. We had to record the sound on audio tape
all digital systems switched off and later produce pictures. Ordinary
PCs are powerfull noise sources up to 500 MHz. Thus audio recording
may still be a good idea.

There are good examples on how to program SoundBlaster in ftp.wustl.edu
/pub/msdos/sound ... SBPROG10.ZIP, SBF3.ZIP, SNDBLST4.ZIP files
with C and assembly language examples. By using this code one will not
need SoundBlaster development kit.

When somebody writes a WEFAX program for SoundBlaster, please let me
know !

P.O.Box u13 tel. +61 67 733752 ------------------------------
Armidale NSW 2351 --------------------------

PS. There has been articles on receiving the digital 1.7 GHz WEFAX
transmissions with a special computer in VHF Communications and Wireless

World (Electronics and Wireless World) magazines. There is also an offical ESA publication (1970's), describing hardware interface for a PDP-8. It would be rather easy to make similar interface for PCs.

There is an error in the sampling frequency. It must be at least
19200 samples per second, ie. four times the minimum theoretical
sampling frequency. I am not sure, wheter it is better to keep as close
as possible the multiples of carrier, 2400 Hz or make random oversampling.
Some experimenting is needed.

Jack, if you are going to continue talking about the Hamblaster as a product with specific abilities, please also at SOME point talk about availiability, pricing, etc. You have been posting updates here for months, but there has been insufficient information to decide if anyone should care.

One of your postings even indicated that the product would be "introduced" at some flea or other, but even after that, there was no word.

What is the big secret? Are you, or are you not going to produce this board?

I tried that already. I even altered the 'KISS.ins' file to ensure that the proper commands were being issued by AmiCom to place the MFJ in KISS mode.

Message-ID: <5086@raven.ukc.ac.uk>
Source record: 50042

I am trying to set up a BPQ node and run it under windows 3.1. I can get
the software to run normally under dos, but when i load up windows things
start to go wrong!! At the moment i am using DEBUG to kill the com ports
and that seems to work, but i am not sure if this is the correct thing
to do.
Also when i load up more than one program, ie Chat4 or term4, or traffic, then
things start to crash, and i have had a few serious crashes in windows
which i don`t like!!

I would be grateful for any advice...

Many thanks inadvance,

Matthew

If you already tried all that, you can only check that you have the correct
settings for your serial port (ie: serial.device, speed etc...)
I don't think that in KISS mode, the program tries to sync.... this is only
for HOST mode! Your problem seems very strange!

It's not hard to build a switch box that will allow you to switch between the TNC and the mic. You can buy a chassis mount jack for the mic connecter (I got mine from HRO) and Radio Shack sells the matching 8-pin plug. I also put a switch on my external speaker so I can shut off the audio (actually, it switches the radio output to a jack that's mounted on the speaker so I can use a remote speaker outside the truck, but it serves as a shut off switch, too). The receive audio is available on the mic jack also.

I'm just a Ripvanwenkel type, thinking of getting into packet,
so please excuse novice question, but
I am trying to figure Packet out just as DSP chips are
going through rapid evolution. I was looking for good buy in
audio DSPs and was looking at a SoundTrax for $289 1-800-260-6771
which has a Motorola MC68EC000 and a STAR SPROC-1400-50
which has 4 DSPs at 10MIPS each for 40 MIPS so it can do
simultaneous two channel A/D and D/A 16bit up to 44 kHz.
(also includes wave table for playing with music).

Has anyone looked into programming this with the included
"Sound Engineer DSP" software or whatever?

I wanted something DC coupled for data acquistion, but it's 20-20KHz should
be OK for packet.

Just curious, Don N6MCE dphelps@simenv.com

Unless they've changed things from the KPC-2 to the KPC-3, you can directly plug it into your outlet. My KPC-2 came with a 12V wall-brick power supply. I threw that out and wired it into my 12V power supply for my other equipment. The KPC-3 _should_ have a regulator on-board to cut that down to what they need.

507. EOSS Balloon Flight In Denver

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-02-18 22:37:50 UTC
From: rickvg@cscns.com
Message-ID: <-CKPjSEHGkfN057yn@cscns.com>
Source record: 50052
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.space,rec.radio.amateur.digital.misc,rec.radio.shortwave

For Followups to this post check the newsgroup rec.radio.amateur.space

Edge of Space Sciences, Inc. (EOSS) is a non-profit organization comprised of individuals interested in the use of high altitude balloon flights to offer an experimental platform for students and other experimenters. The group has a very high level of participation by amateur radio operators, however, this is NOT a requirement for membership and participation.

EOSS has flown 14 successful flights over the past few years. We regularly fly amateur television, and a suite of atmospheric sensors.

Other experimental payloads have included, GPS and LORAN-C for a comparison of their accuracy. Homebrew differential GPS on the same flight. Students of Coloraro University at Boulder (CU) created their own differential system using a gps receiver at a KNOWN location, and calculated the offsets themselves, allowing the GPS vs. LORAN-C comparison greater accuracy.

EOSS hosted last year's "National Balloon Symposium" in Denver Colorado. People from more than 10 states, and Canada were in attendance as well as some of the commercial providers of equipment used in our "hobby".

We plan to fly EOSS-15 soon and here is our general information release about this flight. If you have any questions about the flight or EOSS please use email to my address (sig file at bottom).

EOSS-15 FLIGHT PROFILE

LAUNCH SITE:
Thunder Ridge Middle School
Picadilly and Smokey Hill Rd.
Aurora, Colorado, USA

latitude 39.61195 deg North
longitude 104.75050 deg West

(The lat/lon is actually for a location within 1 mile of launch point. I haven't been to the launch site to take an accruate fix yet.)

LAUNCH DATE: February 26,1994

LAUNCH TIME: 1600 UTC (Set up 1400 UTC) Launch time subject to FAA approval

ON-BOARD EXPERIMENT: Conducted by Cherry Creek High School.

PURPOSE: To measure the various levels of alpha, beta, and gamma radiation at various altitudes.

SHUTTLE FREQUENCIES:
Packet: 144.340
ATV: 426.250
CW Beacon: 147.555
Carries the call of WB4ETT

There will be a HF net run by Sparky\ KA0DPC on 7.232 MHz (phone). And the FOXHUNTER'S will coordinate on the Colorado Repeater Association's repeater 147.225 MHz (+600kHz). This will also be used for some local information during the flight. Thanks in advance to the Colorado Repeater Association for the use of their repeater.

REMARKS: Edge of Space Sciences will provide the platform for Cherry Creek High School and Thunder Ridge Middle School to study the lower atmosphere. Cherry Creek H.S. students have modified a geiger counter to meet the EOSS interface specifications which will measure the alpha, beta, and gamma levels of radiation vs. altitude. The experiment will gather data that should interest local NASA and NOAA officials.

Thunder Ridge M.S. students will make graphs that will help them understand the temperature vs. altitude and balloon dynamics by graphing the ascent and descent rate of the balloon.

The project will be presented at this years Denver, News 4 Education Exposition at the Colorado Convention Center on March 11,12,13 1994. More information about the EXPO can be obtained from EOSS.

Sponsorship for this flight and Education Exposition have been provided by:

Hiya folks. I've got a PK232MBX packet controler, and a RadioShak HTX-202 handheld. I'd like them to become friends :).... My problem is, I assemble the cable as depicted in the manual, The cables check out with the ohm metere (no continutity breaks...) so I plug it in, throw the 232 into calibrate mode and hit k to key up, but the TX lcd segment doesn't light... no info getting out to the real world...

So folks, anything increadibly dumb that is obviously the problem or should I desodder everything and start from square 1?

Dale,

: for HOST mode! Your problem seems very strange!

I have managed to get the software to work. For some reason the MFJ was not switching into KISS mode. I manually issued the KISS ON command while in AX.25 using other term software. No positive response (i.e. "KISS WAS OFF", etc.). After fooling around with it for a bit I issued the RESET command, and the unit locked up on me. I then hard-reset the MFJ by removing JMP5. Upon being turned back on, no further problems were experienced. Once I verified that the MFJ was switching in and out of KISS mode properly, I loaded up AmiCom and it worked perfectly. It appears to be a nice piece of software; the nicest I have seen for the Amiga to date.

Thanks for your help.

: Dale,
: VE7XDB

As I have neither an HTX-202 nor a PK-232, this is a shot in the dark but may be worth looking into. HT's key their transmitters using different methods; some draw a small current from the microphone pin, others make connections to ground. Check the Owner's Manual of your PK-232, there may be a section that deals with this. I know that my MFJ-1278 can be modified internally using jumpers to solve this problem. Or, you may have just soldered the cable connectors incorrectly...

Let me know how you make out.

Well, when I was hooking my HTX up to my MFJ, I found that I had to use
a smaller value resistor than was recommended - I used 1.5K instead of the
2.2K mentioned in the manual and by RS.

It's been working like a charm ever since. (The HTX is great on
packet - I can hit nodes 14 miles away using the rubber resistor, while
in my basement. Of course, I don't usually do that because it would
annoy the other packeters in the area. :-)

512. KA9Q NOS mutation for VAX/VMS?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-02-19 19:49:20 UTC
From: ptorre@maxwell.ee.washington.edu
Message-ID: <2k5qg0$nli@news.u.washington.edu>
Source record: 50057

Here's one I haven't heard before: Among the many mutations of KA9Q/NOS
to various platforms, has any port to VMS been done? The full
functionality of NOS would actually be overkill, as tcp/ip support is
already available via CMU-IP; is there some simple AX.25 KISS-mode
driver that will allow the VAX to talk to my MFJ-1270B?
(The OS is MicroVMS 4.4, incidentally.)

Thanks for any info,
-Phil KB7ZFH (ptorre@ee.washington.edu)

Source record: 50059

The problem you are having with your packet software under Windows is Windows. It is really bad for communications... depending on what speed you are running at, it drops characters, and also (just like OS/2, Linux, etc...) won't allow the directr resetting of the serial port that maybe this software is attempting. If you want to multitask comm software, get something else, basically... or you might want to try getting a new comm driver... there are many good shareware ones, and many good non-shareware ones too.

515. BayCom V2.00

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-02-20 00:39:07 UTC
From: umg@phyvc.AUckland.ac.NZ
Message-ID: <45549.umg@phyvc.auckland.ac.nz>
Source record: 50060

Hi everyone,

Regarding the rumuors about the purportedly imminent release of V2.00 and associated questions, here's some wisdom straight from the horses' mouth, Johannes DG3RBU.

Johannes told me last week that he expected a release this year. There was no word about a release being imminent.

The new version is intended to have a YAPP facility.

It will also no longer be available for copying among amateurs, but will carry individualized call signs. Johannes regrets that it had to come to this, but the relentless efforts of certain people who have used "free" BayCom software to enhance commercial sales of their own clone modems without permission have driven the BayCom team to this decision.

In this context I would also like to warn impatient users from some advertising pitfalls put up by the not-so-honest in the business. While there are some genuine alternatives to the BayCom software such as TFPCX with assorted terminal programs, or AX25DRV and it's derivatives etc., some pirates have come up with programs that are based on outdated BayCom versions. A visiting German amateur recently gave me a program named PC-COM which he insisted had been given to him for free as the "latest BayCom software". On close inspection, it turned out to be a program with a fancy coloured start-up screen, based on BayCom version 1.2 which at that stage was at least two years out of date.

The current BayCom version is V1.50a, with some special compilations for certain regions. Unless you are attempting to run 300 Bd with a version V1.50, there is probably no reason to upgrade to V1.50a or any other 1.50-version that is worth the effort.

I'm in the process of setting up a Packet BBS.

The system is to run BPQ with two VHF ports (UHF or 6m may be in the future).
The BBS software if FBB5.15C. JNOS is a possibility....probably after my
copy of Desqview arrives.....probably in a week or two. I also have a
Telebit T2500SA on the BBS.

Can some Sysops who are also running FBB/BPQ systems please Email me their
configuration files?

Please email to "dreamer@lhaven.uumh.ab.ca", my feed to this group is currently
down...so I probably won't see any followups.

Probably the simplest and yet most accurate way is to synch both computer
clocks to the same time code source, either WWVB or GPS. Receivers for both

are easy to build in the well-stocked electronics lab, or can be purchased
commercially from multiple sources.
There is a three-part construction project for a WWVB receiver system
currently running in 73 magazine's Jan, Feb, Mar 94 issues which may be of
interest to you.

Source record: 50065

>1. Can a Technician class license use 6m?

Sure, look in your license manual, you can use all of 6 meters, except for the segment from 50.0-50.1. That's CW only (you can still use it, but only for CW!!)

>2. How many stations/nodes etc can be found on 6m?

Not many, this may vary from area to area, but in the east coast, I don't know of very many individual stations on 6m packet, if any, it's being used as a high speed backbone, (BBS to BBS links only), so I don't know of any individual stations on 6m packet. (this is in the northern Delaware area)

>3. What kind of "range" can be expected at 6m?

Depends on band conditions, antennas, power, etc. Figure about a 50 or so mile radius again, depending on the power, antennas, etc. Under special sporatic E or F layer propagation, you can talk across the country on 6, but during normal conditions, figure about 50 or so miles, some more, some less, depends on the individual station.

>4. Is Packet at 6m any different than at 2m?

Well, as I said, around here, 6 was only used for backbones. I could be wrong (it wouldn't be the first time!!), but most people shy away from 6 due to TVI/RFI concerns. Especially if you're going to use FM, I'd be careful to have a really clean and well filtered setup, especially if you're going to run more than just a few watts. My suggestion would to go up on either 222 or 440 and see if there's anyone up there first before trying 6, or maybe even go to 10. The 10 meter monoband/25 watt rigs are cheap now, and the band is begging for use, so if you put up a node there, especially in the 28.1-28.2 segment, both novices, and technicians (with code) can use it. You'd probrably find a few more users up on 10 than 6.

Good Luck,

Joe KI3B

521. KAM plus vs. PK-900 question

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-02-21 15:54:07 UTC
From: peterson@physc1.byu.edu
Message-ID: <1994Feb21.085407.1404@physc1.byu.edu>
Source record: 50066

I am looking at purchasing a good multi-mode controller. It appears that the two that fit the bill are the Kantronics KAM plus and the AEA PK-900. They both appear to support simultaneous operation on HF plus VHF packet. However, the PK-900 specifically states that it is possible to add 9600 baud packet to the box but the KAM plus does not. Does anyone out there know if the KAM plus can be modified or upgraded to support 9600 baud packet on VHF?

Thanks for your help.

523. aprs400.zip - Hams: Automatic Packet Reporting System (APRS)

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-02-21 18:23:31 UTC
From: TPDugan@DOCKMASTER.NCSC.MIL
Message-ID: <9402211823.kp249@SimTel.Coast.NET>
Source record: 50068
Cross-posted to: comp.archives.msdos.announce,rec.radio.info,rec.radio.amateur.digital.misc

I have uploaded to the SimTel Software Repository (available by anonymous ftp from the primary mirror site OAK.Oakland.Edu and its mirrors):

pub/msdos/hamradio/
aprs400.zip Hams: Automatic Packet Reporting System (APRS)

APRS avoids the complexity and limitations of trying to maintain a connected packet radio network. It accomplishes the real-time display of operational traffic via UI frame broadcasts and map displays. A station with information to contribute transmits it, and all stations receive it.

APRS automatically tracks mobile packet stations interfaced to GPS or LORAN, and works just as well with manual tracking. Specific applications include weather nets, direction finding, plotting satellite contacts, and so forth.

Where is the Army-Navy game football, the event leader, the fire? What's the weather like at various points in the county? Where are the power lines down? Where is the flood, the hurricane, the earthquake?

Be careful with this DSP. I looked into it myself. It has
impressive specs, however, (i'm not shure but I believe) it
doesn't have very much memory. The SoundTrax board with the
SPROC processor is devoted to a limited application, a 24 channel
stereo graphics equalizer.

525. Hamblaster Update

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-02-21 18:30:17 UTC
From: jwa@tellabs.com
Message-ID: <1994Feb21.183017.27027@tellab5.tellabs.com>
Source record: 50070

2-15-94

I hope that this will clear up a few questions about
the Hamblaster.

Disclaimer

This IS NOT an ad. The Hamblaster is not a product
that's being sold to amateurs or any other group.
It's a 3 year effort by myself and Will Torgrim N9PEA.
We have been doing this as a hobby, hopefully, to
improve Amateur radio. Unless we are ready to sell
the Hamblaster as a product or if we can get someone
to back us, I will continue to post our progress.

Finely, we have spent thousands of dollars to develope
the Hamblaster and we haven't earned a single penny
for our efforts. So how can this be an ad for profit?

The Hamblaster is not a software package. It requires a
special sound card that uses a Texas Instruments TMS320C25
DSP to run filters or audio demodulators. It can interface
to a TNC via a TTL digital port and replace the TNC's poor
filtering.

It's not compatible with other sound cards but it can
co-exist with them. I use my Soundblaster Pro and Hamblaster
together. I can, for example, run a filter on the the Hamblaster,
connect it's output the Soundblaster and record a CW signal using
the SB software under the Windows environment.

More "info"

1) External Power supply

I think one feature that separates the Hamblaster
from other sound boards is it's ability to run on
an external 12 volt supply. When a filter or modem
is loaded, you can turn off the computer and it
will stay active.

When it's connected to a PK-232, there's no need
to leave the computer on in order to keep the DSP
alive. Right now, my PK232/Hamblaster is runing
and it's been operating for about two weeks.

There still some developement work being done and
I'm told that the power supply will be on a small

PC board and sold as an option for about $20.00.

2) Adaptive (LMS) filter

There's ongoing developement in this area. We are
planing (I don't think this has been done before)
to add controls to the LMS algorithm.

Eureka! It works! 2-21-94

I just received a call from Will last night but I
wasn't home. :-< However, my answer machine got it.
He held the phone next to a speaker and I heard SSB with
a carrier and some other interferance. He pressed
a button on his computer and the hetrodyne was gone.

I don't have any details about the software except
that it works. I'll keep you posted.

526. NPFPMS available via ftp

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-02-21 19:53:09 UTC
From: John@g8dzh.demon.co.uk
Message-ID: <761860389snz@g8dzh.demon.co.uk>
Source record: 50071

A full shareware version of the NPFPMS Multi-user PMS (version 2.16) can
now be ftp'ed from

ftp.demon.co.uk /pub/ham/npfpms.exe (336,697 bytes long)

The PMS is written, by Ted Harrison G8NPF, to run as an application under
BPQcode (4.05 or greater). The computer should be a 286/386/486 PC compatible.
The PMS code will *NOT* work on a XT (8086/8088 cpu) system, sorry!

The PMS requires MSDOS >=3.3 or DRDOS >=5.0, and 640K ram. It will also run as
a DOS application under OS/2, WINDOWS and DESQview. A hard disk is essential
and a reasonably fast PC is advisable.

The PMS includes virtually all 'BBS' commands, many of which have been modified
to suit a PMS, rather than a BBS, system. It features, among other things;

Multi-user access. 'Simultaneous' operation on all channels.
YAPP binary file transfers and Ascii file transfers.
Automatic message forwarding.
FBB compatible bulk ascii & compressed message forwarding.
FBB 'ACK:' type messages.
NNA compatible bulk compressed message forwarding.
Automatic password verification when forwarding to and from a BBS running
the latest version of G1NNA's code (NNA v2.03 April 93).
REQDIR, REQFIL, FNDFIL and WP servers.
Automatic date-expired message killing/deleting.
Automatic Listing and Reading of mail on the local NTSBBS.
Full function text editor.
Local terminal mode, with all normal terminal functions.
Multi-colour displays.
User database and WP database.
Support for 7PLUS files.
Support for DESQview
.....plus lots more.

If your HT keys when there's a current drain in it's microphone port,
you can check out the current need to activate transmission by connecting
the leads through a variable resistor. Adjust a 10K potentiometer until
it just keys the unit. For a reference point, I've found that the Yaesu
FT-416 keys with just under 3.0K in line or a current greater than about
1.7 mA at 5V (Normally the unit "expects" to see a microphone with 2K
impedance, or a 2.5 mA drain, for TX keying).

>to be reachable.

Numerous hosts on the ampr.org are not declared in the nameserver database
because usually people who assign the 44.xx.xx.xx IP addresses do not
register them to ucsd.edu.
And even if there is an entry in the nameserver database, it's not
surprising that hosts are unreachable. The Internet and AMPRNet are
two separate networks. Only a few hosts on AMPRNet are connected to the
Internet trough gateways.

Here is the header of the nameserver table.

```
@ IN SOA ucsd.edu. brian.ucsd.edu. (
94022213 ; Serial
360000 ; Refresh
3600 ; Retry
3600000 ; Expire
864000 ); Minimum

IN NS ucsd.edu.
IN NS trout.nosc.mil.
IN NS hpcsos.col.hp.com.
IN NS w1mx.mit.edu.
```

You can download the nameserver tables via anynomous ftp to ucsd.edu
in /hamradio: ampr.org and ampr.org.rev.

>2. Who is doing mail (MX) forwarding for ampr.org?
>
I don't really understand your question. Anyone can define a MX for
a machine on the ampr.org domain.

>73 de VE7MDL (erik@ve7mdl.ampr.org) ....Erik.
>

>(IP address: 44.135.160.50)
>
Are you sure ? According to the nameserver
44.135.160.50 = ve7abw.ampr.org
44.135.96.92 = ve3.ve7mdl.ampr.org
and ve7mdl.ampr.org is not registered.

Greetings fellow hams,

I just recently installed nosview304 on my pc.
Using the appopriate local domain.txt file, I keep
getting "Host Unknown" whenever I try connecting to
another node. I can connect to loopback (set to
127.0.0 in domain.txt) and the software talks to the
tnc okay. Anyone have any ideas on what the problem
may be? Thanks in advance.

>peterson@physc1.byu.edu

I currently have both the PK900 and the KAM with version 6.0 firmware. I find that both units are very good. I prefer the PK900 over the KAM however due to its more advanced host interface.

As far as the 9600 baud operation, I do not think that the KAM is capable of this operation.
I scanned the users guide for the KAM and did not see any mention of 9600 baud packet or the standard modem disconnect header.

hi matthew...

try setting maxcomport=x in your system.ini file, in the [386Enh] section
of the file, where x is one less than the number of comports that you have...
then put bpq on the last comport... for example, if you have 2 com ports,
set maxcomport=1, then use com 2 for bpq... the maxcomport entry tells
windoze how many comports to grab...

and i had the post inquiring about baycom 2.0... please email me if you
find a release i can grab via ftp...

>sfarlow@sugar.neosoft.com

Hi Stephen,

I believe we had this conversation before on the rra-wg mailing list. I referred you to "How to Create a New Usenet Newsgroup" on news.announce.newusers, and examples of RFD and CFV announcements on news.announce.newgroups. I encouraged you to come up with a draft RFD yourself, which I offered to review (Although I don't support your proposal, I generally support the RFD/CFV process in principle).

Anyone can initiate this process, so even though the members of rra-wg (who initiated the last rec.radio.amateur.* newsgroup reorganization) decided not to pursue a re-examination of rec.radio.amateur.digital at this time, the matter is still very much open for a motivated (and qualified) person to pursue.

Incidentally, the reasons that I and others decided not to call for a revote in 6 months (Jan. 94) like we announced we would were as follows:

- rec.radio.amateur.digital.misc and Ham-Digital have almost seamlessly taken over from rec.radio.amateur.packet and Packet-Radio without much fuss and have easily encompassed all packet discussion (vanilla X.25, TCP/IP, Clover, etc.).

- The tension we previously noticed on TCP-Group with novices and their questions undermining it as an "expert" forum seem to have gone away (at least for the 6 months that I've been following the list). Possibly r.r.a.d.m has offloaded some of that demand, or perhaps the "threat" to make a Usenet newsgroup for radio TCP/IP has encouraged the users of that mailing list to manage it better.

- There was strong support for the rec.radio.amateur.digital hierarchy at the last vote, but that was tempered with a desire to not create too many newsgroups under it for now. Barring a clear mandate for another newsgroup, we're going to hold off for the time being.

But again, it's possibly that our viewpoint is slightly off, and there may be pent-up net demand for another newsgroup. I encourage those who

want their voices heard to pursue the RFD/CFV process. One way to pursue this is to join the rra-wg mailing list (rec.radio.amateur Working Group), which is a forum of FAQ maintainers, net experts, and volunteers who would be happy to advise you. To subscribe, send E-mail to rra-wg-request@amdahl.com.

536. Monitoring with Modem?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-02-23 07:26:57 UTC
From: jcox@lakes.trenton.sc.us
Message-ID: <mVV7Hc1w165w@lakes.trenton.sc.us>
Source record: 50081

We are trying to set up a local area packet network and are monitoring several freqs looking for a clear one. There are several candidate freqs that have 2400 baud activity on them, and I need to find out if they're local or just due to band openings. Trouble is, I don't have a 2400 baud packet modem.

I have a 2400 baud telephone modem in the packet computer. Is it possible to set up the telephone modem to monitor the raw data? All I'm hoping to find is some callsigns, and that might be discernible in the data stream. Any thoughts or Hayes modem commands for setup?

Thanks,
John WD4PKZ

AX.25 is used and was developed specifically for the amateur community.
However, in our area there are several _business band_ users using a type of
packet that amateur TNCs can not decode. The signals sound VERY similar to
amateur packet (seems like 1200 baud FSK). Is/are there any commercial radio
standards equivilent to AX.25? Proprietary?

Harold

Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.digital.misc

Does anyone know where to find or how to build a radio receiver that
picks up MSK (minimium shift keying) modulated 100 bits/sec data
transmitted on aprox 300 kHz carrier signal?

This would be used to receive differential GPS-corrections from a
reference station.

Any pointers?

I'm going to climb out on a limb here and ASSUME that the PC
modem is a standard Type 212, which uses 1200 baud PSK, not
the standard 202 used by the amateur community. I can guarantee
that the ComStation V is also not compatible.

>
> I don't know that much about PACKET, but is it possible using that
> hardware (one of these two platforms) and some fancy software to start
> doing PACKET. Am I crazy or is it a good challenge?
>

Unfortunately neither modem uses the FSK tone pattern
(1200 Mk/2200 Sp) that is standard for packet operations on VHF.
They also do not support the 170 Hz shifts (2125 Mk/2295 Sp or
1200 Mk/1370 Sp) used for HF packet. Therefore you should abandon
the idea of using these particular pieces of hardware, but don't
drop the project!

Instead might I suggest that you build a simple one (XR2207) or two
chip (XR2205/XR2211?) "modem" which you CAN interface to the PC of
your choice. Now you have home-built a Baycom equivalent interface,
though probably not so small as to fit inside a DB25 connector.
Software to perform the AX.25 coding is available for either platform
on several FTP sites - use the stuff labeled Baycom.

You'll note that the narrow shift is the same as used for RTTY on HF, so
the suggestion that follows could become a multi-mode unit if you can find
RTTY software as well as packet.

I'm sure there are several packeteers in your area who would be happy
to assist you in homebrewing what they spent several hundred C$ to
purchase. In addition to saving money, you will learn more about RTTY,
packet, and modems this way. By the way, hams never SAVE money, they
just allocate it toward the next pending project!

Source record: 50087

I know this is not what this group is usually about, but I've posted a message on the video groups, and have no intelligent answers, and I know most hams are into a variety of electronics.

I am looking for someone who understands VHS VCRs, possibly a repair tech or the like to explain why, in the 2 VSH VCRs that I've used, while scanning in forward or reverse, and I issue the command to scan in the opposite direction, the VCR pauses a second or so in freeze frame, while I hear a motor whirring inside before it is able to go in the opposite direction. This is not to be confused with going fast forward or rewind with the tape wound back into the cassette. None of the Beta machines I've had do this. They go instantly from one scan direction (with picture) to the opposite direction.

I you wish to post publicly, fine, but would you send me EMail letting me know you've posted an answer so that I can rush back and look. I am soon to be in the market for a VHS VCR and I use them for studying films, TV shows, etc., and that pause with VHS is driving me crazy!

Thanks for your patience.

hi bryan, mitch wa4osr here in mobile, alabama...

i have not used the kam, but have had a pk-900 plus the 9600 baud
board for it... it is a nice unit but a *power hog*... it pulls
over an amp... other than that, it is a superb unit... the modems
work great, and the software is typical aea... the 9600 baud board
works great, and the output waveform at 9600 baud looked almost
as good as the dsp-2232... way better than the mfj or pac-comm
9600 baud units (lots of am)... the other negative is that it
is a *BIG* box... you could easily put probably about 4 cams
in the pk-900... either unit is very good, but if you plan on
any 9600 baud work, terresterial (lots of dx clusters are going
to require users to go to 9600) or the pacsats then the pk-900
is the preferable unit...

Hallo,
a friend of mine is trying to start with packet-radio. He is equipped with
ALINCO DR590 and home-made Baycom Modem. Unfortunately the nearby digipeater
is not able to decode his transmitted signal. The modulation is not clear.
With Handy C528 the equipment works well.
But I think the DR590 is not wrong.
Does anybody have a hint to solve the problem?
Thanks for reading this message!

Intresting,

I have heard the same 'type' of thing on 450(comm/gov) here as well. The only 440 rig I have is am HT, and I haven't built a cable to interface it to my TNC. I was going to try to MONITOR and then use the TRACE command. It should show even non-AX.25 stuff comming across. Right ?

Have you tied this ?

Would be intrested in the outcome if it works.

> AX.25 is used and was developed specifically for the amateur community.

AX.25 was derived from the commercial public standard protocol X.25, and the two are similar but incompatible protocols, due to changes primarily in the addressing structures. Packet is not a protocol, it is a technique or methodology of sending long messages in several shorter bursts.

> However, in our area there are several _business band_ users using a type of
> packet that amateur TNCs can not decode. The signals sound VERY similar to
> amateur packet (seems like 1200 baud FSK).

There is a VERY good chance that they are using the same type of modem and tone constellation, which is that of the Bell 202 modem. In fact, if you simply connect a 202 modem to the receiver audio and watch the data output on a computer screen, you'll see the ENTIRE contents of the data burst, not just the encapsulated text. That's exactly how a BayCom modem works - your computer does the work of the Packet Assembler/Disassembler (PAD).

The eavesdropping technique will work with any protocol, by the way, but if the data is encrypted it does not decode it for you. WARNING: If the transmissions are encrypted or otherwise made inaccessible to a casual listener, it is illegal for anyone to monitor the transmissions. In this case the Electronic Communications Privacy Act supercedes the idea that if a signal is in the air it is fair game.

> Is/are there any commercial radio
> standards equivilent to AX.25? Proprietary?

The commercial boys probably use X.25 protocol because it is compatible with many land-line networks including this one. As noted, X.25 is public and was the basis of AX.25 development

Yvan, your project sounds very similar to what I'm trying to do.
My project involves a satellite transmission received by a dish
carrying packet data which is decoded and displayed on a high-res
monitor. A rep from the company who transmits this service told
me yesterday that this signal is at 38,400 baud!! Major stimey
for me. . .

>Unfortunately neither modem uses the FSK tone pattern
>(1200 Mk/2200 Sp) that is standard for packet operations on VHF.
>They also do not support the 170 Hz shifts (2125 Mk/2295 Sp or
>1200 Mk/1370 Sp) used for HF packet. Therefore you should abandon
>the idea of using these particular pieces of hardware, but don't
>drop the project!

Does the above info apply also to satellite transmission at over 3 Ghz?
This is a service transmitted by a company for specific market data.
I am merely attempting to discover if my idea is valid or not. The
company's systems could not be that sophisticated, because they are not
very expensive to lease. . . Total (standalone) equipment involved is:
- an 18" satellite dish with coax cable runing to ...
- a 'decoder' box (about the size of a mini-desktop PC) with a ...
- high-res monitor attached.
(I have not been inside the decoder box to see the hardware,
but it is supposed to have its own satellite receiver and
3 processors (for signal decode, data display, and ??))

What I want to do is:
replace the decoder box with a small satellite receiver and run the
signal directly into a modem on my PC and decode the packet data in
software; then display the data on my PC monitor.

Problems I foresee:
interference on my PC from the 3 Ghz frequency,
the tone pattern standardization mentioned above

As you can see, I'm new to this type of communication, and am fudging
my way through; learning as I go. Karl, can this idea of mine work?
Even theoretically? Anybody else have input?

I dropped all HAM stuff and picked up a pair of commercial wireless network
cards. They operate at 902-928 1/4 watt. They give you 2meg/sec. They
have packet drivers. FTP transfers are 120k/sec when transfering BIG files.

The cards are made by NCR and are called NCR wavelan. There are a few OEM
relabeled versions of the same.

I currently pass ipx, ipx and appletalk through my link. I am using it now.

I'm very interested in hearing about megabit per second packet. I'm
interested in hearing about what it takes to do packet above 2400 baud.
I would like to setup a link 40-50 miles away that is relatively fast.
I don't mind building things, so if all it takes is building a modem,
no problem. I'm sure it's harder than that though. :(

555. MUD for packet

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-02-25 17:57:16 UTC
From: swood@vela.acs.oakland.edu
Message-ID: <swood.762199036@vela.acs.oakland.edu>
Source record: 50100
Cross-posted to: rec.radio.amateur.digital.misc,rec.games.mud.misc

Well, I just made the interesting discovery of how much 'like' internet
the packet tcp/ip is. (ie It is in many cases part of internet - doi)

Anyway, I was working on trying to add an ax25 front end to a mud
system. I, however, am aware that most tcp/ip stuff should work fine
on packet tcp/ip and have even test logged in to a few internet muds
(quickly and not into the actual game) from the internet side.

What I was wondering was if anyone would be interested in modifying
a mud on a site somewhere to service strictly packet tcp/ip operators?
It would involve requiring an id (and probably callsign verification)
prior to receiving a character. Wall style commands would need to be
costly and coding short and sweet to cut down unnecessary bandwidth.
I was even wondering about the necessity of a 'language content' filter
but I believe that could be avoided by resticting access specifically to
amateurs.

Due to the speed of internet, it would be preferable to run on the
landline side of internet as compared to the packet world. Heartbeat
rate would be reduced as well as any other speed related items to provide
for fair play.

I would be interested to know if anyone would be interested in helping on
such a project and what other suggestions or issues could be brought up
in relation to this. Though it was my desire to make a mud available on
an off frequency at ax.25 style connections, it would probably be much more
beneficial to all to use a slim and trim mud where ax.25<->tcp/ip connections
already exist.

Subject: Time:12:43 PM
OFFICE MEMO Digital Conference Date:2/25/94
This is a revision to a previous bulletin on this subject. Due to a misunderstanding with the Thunderbird Hotel and Conference Center, the information on room rates in the earlier release is incorrect. Sorry for any inconvenience this might have caused. Anyway, here's the corrected announcement and call for papers:

1994 ARRL DIGITAL COMMUNICATIONS CONFERENCE

ANNOUNCEMENT AND CALL FOR PAPERS

(Rev. 1, 2-25-94)

The TwinsLAN ARC will sponsor the 1994 (13th annual) ARRL Digital Communications Conference August 19-21 at the Thunderbird Hotel and Conference Center in Bloomington, Minnesota, U.S.A.

The objective of the Conference is to create a forum for radio amateurs and experts in digital communications, networking, and related technologies to meet, publish their work, and present new ideas and techniques for discussion. Presenters and attendees will have the opportunity to exchange ideas and learn about recent hardware and software advances, theories, experimental results, and practical applications.

AGENDA

The agenda for the three-day event includes informal activities for attendees and family members on Friday, August 19 through noon Sunday, August 21. Formal conference activities, including presentation of papers and forums are scheduled for Saturday, August 20, from 8:30 am to 5 pm. A detailed agenda will be available when schedules are finalized.

CALL FOR PAPERS

Anyone interested in digital communications is invited to submit a paper for publication in the Conference Proceedings. Presentation at the Conference is not required for publication. Papers are due by June 20 and should be submitted to Maty Weinberg, ARRL, 225 Main St., Newington, CT 06111 U.S.A. or via Internet at lweinber@arrl.org.

If there is a topic you think should be included in the Conference, or someone that should be encouraged to publish and/or present his or her accomplishment, please contact Rick Whiting, W0TN, by Internet e-mail (preferred) rick_whiting@atk.com, or by MCI Mail, CompuServe 71445,377, or U.S. Mail to 5780 Rosewood Lane N., Plymouth, MN, 55442 U.S.A.

ACCOMMODATIONS

The Conference site is located near the Minneapolis/St. Paul International Airport. Free 24-hr shuttle service is available to and from the airport.

For information on room reservations, NW Airlines ticket discounts, Twin Cities visitor attractions, etc, please contact Cathy Thomas, Mainline Travel, at 1-800-726-6715.

A FAMILY WEEKEND

Family participation in the Digital Conference weekend is encouraged. The hotel has a large pool for guests. Informal outings are planned to the Minnesota Zoo (admission extra) and the Mall of America, the largest indoor shopping mall in the U.S. Free scheduled shuttle service is also available from the conference center to the Mall. Minnesota is a great place to visit in August. Consider making this weekend an addition to your family vacation plans.

REGISTRATION

The conference registration fee is $45 per person, which includes a luncheon buffet, a copy of the Conference Proceedings published by ARRL (including papers submitted but not presented) and transportation to the Mall of America on Saturday evening. Registration, by check payable to "TwinsLAN Conference", must be received by August 12. Mail your registration to:

How much are these cards? If I remember right, 902-928 is a shared band with
hams, if so, do you think there would be enough information about these cards
to provide an external amplifier and antenna? I'd like to go a few miles
instead of a few yards.

Thanks
Jay

From: fncgshx@gsusgi2.gsu.edu
Message-ID: <1994Feb26.192249.21936@gsusgi2.gsu.edu>
Source record: 50108

I am a novice in packet radio. I want to know more about setting up a communication link using packet radio. I've checked faq - doesn't help much.

My friend lives about 50 km from my home. His house is not connected by a telephone line yet (telephone lines are scarce resources in my country). So using modem is out of the question. We like to link our PCs using packet radio instead; he has a call-sign anyway.
My questions:

- What's the feasible range of packet radio, and at what speed ?
- Is it possible for speed > 1200 bps ? 1200 bps seems too slow. To transfer 120 kbytes file will take 20 minutes.
- How much does a TNC cost ?
- Is TNC software controllable ? I mean, if one frequency is 'noisy' then can TNC switch to other frequency automatically (programmable via PC) ?
- Some people use CB for longer range (voice). But I think it is more noisy than FM. Is CB suitable for packet radio ?

Any reference to 'guide to using packet radio' handbook or manual is appreciated.

Thanks.

SH.

There's a lot of stuff on the Internet that can't legally be sent over
packet. How do you plan to filter that out before you have a chance to
look at it?

It is my understanding that this service is 1 Watt ERP, so using a directional antenna, one must back off the power to stay at or below 1 watt effective radiated power.

Note that the real intent with the NCR wavelan was to wire up an office space where cabling was difficult to install. Also note that NCR sells its directional antenna (a yagi with 75 ohm match) for $1995.00!

>My questions:
>
>- What's the feasible range of packet radio, and at what speed ?

Well there are probably a few hams who could punch a packet signal to Mars if they tried. Certainly there are amateurs who routinely access orbiting satellites via packet, and HF stations use the ionosphere to bounce packet signals around the globe. However, most packet is either line of sight at VHF/UHF or somewhat beyond line of sight via scatter and knife edge refraction. Speeds vary wildly depending on the particular modes and paths. HF is limited by regulation, and by propagation characteristics, to 300 baud. Satellite links are usually 9600 baud, and terrestrial line of sight and near line of sight can vary from 1200 baud up to megabaud+ speeds at microwave. Unless you have good height above average terrain at each end of your 50 km path, you'll either need relay stations in between, or use a slower speed, say 56 kilobaud, with forward scatter propagation.

>- Is it possible for speed > 1200 bps ? 1200 bps seems too slow. To
> transfer 120 kbytes file will take 20 minutes.

Longer than that in practice. In the first place, packet is normally done on half duplex links, and AX25 is an ARQ protocol, so you can send a maximum of 7 256 byte frames before you have to turn the link around and wait for an acknowledgement. Link turnaround can take between 0.5 and 1.0 seconds with 1200 baud VHF rigs in common use. If there was a transmission error, you have to back up and resend everything after the error.

And if you need a relaying station, called a digi in amateur practice, then each digi cuts your effective thruput in half because it has to receive the entire packet, store it, and immediately retransmit it to the next station. It can't receive while it's transmitting, so you have to wait. After a couple of hops on a shared 1200 baud channel, your effective thruput drops to 10-15 baud.

So you ideally want to run full duplex if you can, and do it on a
non-contending low error rate channel with intelligent relay nodes
that retransmit on an alternate frequency, called a trunk, so you
can avoid the halving of thruput at each hop. And you want to run
at the highest feasible baud for the paths you need. In practice
that's generally 19.2 kb or 56 kb with current path lengths and
equipment.

>- How much does a TNC cost ?

Prices vary from around $120 to over $400, depending on features,
for an external TNC. However, at higher baud you'll likely want
to use an internal PC buss card that can do direct DMA. The bottleneck
at higher speeds becomes the RS232 link between the external TNC and
the computer. An internal card like the Ottawa PI2 card runs about
$125, and can support speeds up to 56 kb (and perhaps beyond). PAD
functions are handled by host computer software.

>- Is TNC software controllable ? I mean, if one frequency is 'noisy'
> then can TNC switch to other frequency automatically (programmable via
> PC) ?

TNCs are not radios. You need a radio to transmit and receive the packets.
TNCs are little computers, usually Z80 based, that do the PAD (Packet
Assembler Disassembler) function, do channel access control, and do flow
control to the host computer. They also usually have a built in low speed
modem, usually 300 and 1200 baud, that generates and decodes audio tones
that are sent over a voice grade radio that you supply. For higher speeds,
the voice grade radio won't suffice, and you need an external higher speed
modem. At 9600 baud, you can use a modem connected to the TNC modem disconnect
header fed into a modified voice radio. At higher speeds, you need an RF
modem that is a modem and radio in one that's designed specially for packet
service. At 19.2 kb, Kantronics makes the D4-10 for the 440 MHz band. At 56 kb,
GRAPES markets an MSK RF modem that needs a following transverter to convert
it's 29 MHz output up to a UHF channel. At megabaud+ rates you'll have to
homebrew a microwave solution.

>- Some people use CB for longer range (voice). But I think it is more noisy
> than FM. Is CB suitable for packet radio ?

If you can find a quiet channel (good luck), AM CB rigs can work at 1200
or 2400 baud for short links of 15-30 km. The problem here is twofold.
First, it's illegal in the USA, though it's OK in some other countries,
to transmit data on CB. Second is skip. Because of the frequency band on
which CB works, you'll be plagued by skip signals arriving via ionospheric
refraction from hundreds or thousands of miles away. These will interfere
with your packet transmissions. You're better off with a dedicated channel
such as some that are available at VHF/UHF/Microwave in the commercial and
amateur bands.

You also can't encrypt anything in amateur radio. I've forgotten what the exact wording is, and I'm too lazy to look it up, but basically if other people can't understand it you aren't allowed to transmit it.

I am not sure how high hams can go on that band. Remember we share that
frequency so the 1watt limit may not apply to us.

Yes, that is true however crushcraft or sinclair will sell you the 'same'
antenna (yagi) for just over $100.00. NCR yagi, what a rip off, but I like
their cards.

ps: I just looked up in the Canadian RIC-25 (regulations) Part 58.4b states
750 watts carrier for non-sideband emissions.

574. Errors in TNC2 firmware???

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-02-28 06:25:08 UTC
From: byon@csulb.edu
Message-ID: <2ks2o4$6tc@tern.csulb.edu>
Source record: 50119
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.digital.misc

I have recently been experimenting with TNC2 clones and had run across two peculiar "bugs" in the firmware of an MFJ 1278, and a tiny TNC2.

The first problem relates to when the TNC2 sends to the computer the "Change incoming stream" command ("|B" to switch to stream B, for example). It seems that when in command mode, the TNC set the output stream to be equal to the input stream whenever it sends the "cmd:" prompt (if, of course. the output stream was set to something else previously). So it you are in command mode in stream A, and send a "|b" to set the input stream to B, and press Enter, the tnc will respond with "|Bcmd:" to tell that the output stream should now ALSO be set to stream B. The problem is this: The stream switch is sent JUST before sending the cmd: prompt. So if you are on stream A in command mode, and type "|bcst<CR>" to set the input to stream B and get the status of all streams, the tnc will send the results, THEN the |B, then the new cmd: prompt. SO, the output of the cst request made on stream B will be sent to stream A. In fact, the results will show that the input stream is B, while the output stream is A! Of course, if you type another "cst<CR>", the results will be sent to the proper stream, because it has already been corrected. Do all TNC2's exhibit this feature?

The second problem is more major. I seems that when I am connected on two streams, and send text out on the first stream, and then switch to the second and do nothing, all output from the tnc is halted. For example, if I am connected on stream A and B to two bbs's, and I am currently on stream A, and I send "l<CR>|B" to list all files on the first bbs and then switch my input to the second bbs, the tnc will halt all output back to me. The results of the list command will come back to the tnc, and the tnc will receive them all internally, but will not send them to the computer....UNTIL I sent something to the tnc first. (Usually I send "^ck<CR>" to enter and then leave command mode. This will then allow all buffered data to be sent to me. However, it you do not send anything to the tnc, it will send nothing to you.

I have found these problems by using paKet 5.1. PaKet creates a different window for each of the tnc's streams, and pressing a shifted arrow key allows you to switch between the streams. When you do this, paKet sends a "|" and the stream identifier. Therefore, it is very easy to switch to another stream to view incoming data, without wanting to send anything, thus causing the second problem. And having entering a command in one window and having the output

return in another window (the first problem) was also easily spotted. I have reproduced these problems using a simple terminal, so they are not errors with paKet.

One other note. I have also played with some Kantronics Tnc. They do not appear to have the lockup problem, but have an even worse version of the first bug. The incoming stream sent from the Kan TNC's is only changed when data comes in from over the air, not from commands. So if I am on stream A, and switch to stream B, SEND a <CR>, (this would fix the TNC2 problem), and start sending commands, the tnc never send me the stream switch command, so all the feedback from my commands always goes to stream A, (or whatever the last stream to receive over the air was). This is very frustrating when using paKet!

Anyone have any comments on any of this? Has anyone else experienced this? Any ideas for solutions?

Thats illegal. Cant send information on ham radio that is encrypted.
Compressed data between FBB software even seems to stretch that a bit.

Actually the wording in the various rules is almost identical. The
difference is in the ernforcement.

Internet is not to be used for commercial (business) purposes and "obscene"
messages are illegal everywhere, even on a private telephone call.

The more I look at this, the more convinced I am that this is nothing more
than a red herring.

> Is this a daft idea? Have people done this before? Are there simpler ways
> of achieving the same ends (apart from paper mail ;-)?

No, it is a very good idea, and there are a few brave souls doing this already. I expect to be much better informed a year from now :-)

There are several barriers as well as a few solutions:

(1) There are e-mail gateways to/from the packet network. I suspect that you may get e-mail from one of the operators explaining this further.

(2) Use of the gateways is limited to licensed amateurs for various reasons. You can receive a message originated by an amateur, but in general can't originate one. Sometimes (see below) you can get a freind who *is* licensed to "originate" the message.

(3) Depending on which country you/they are in various "third party" and "business communication" restrictions apply. The definition of these terms is different in different countries and is further complicated by the location of the gateway!

For example, if it all happens within the US (or they are on the high seas in a US flagged vessel) then of course US rules apply, but if one or more of the components (such as yourself) are in another country the lowest sub-set of the rules applies.

In some countries the *only* message allowed is "Call home" if there is a dire emergency! Others allow no amateur operation, etc. These rules is the same for voice or packet, but there are added complexities because of

the location of the relaying stations.

I had a freind in the UK who got into trouble a few years ago because he passed no my "Merry Christmas" to a relative who was in the his shack! They tell me that this has relaxed some though.

(4) There are a limited number of AMTOR/Pactor/Clover/etc. HF BBS stations. There are lists available (mine is at home or I would suggest a few), as usual the problem is finding the first one.

(5) One e-mail correspondant dropped some hints about "great things" in the works for people wanting to do this. I am waiting to see what develops!

>Yup, it's called AMPERNET, or ham's running a NOS type of program.

Slight translation. There's a block of IP addresses (a class A network, 44.0.0.0) allocated for amateur radio use. The 44.0.0.0 block is known in the tables as AMPRNET (Amateur Packet Radio Network, I think?).
A lot of amateurs use the TCP/IP protocols over radio using 44.0.0.0 addresses, usually running a version of a TCP/IP package written by Phil Karn, KA9Q that supplies IP services under MS-DOS. Some people running Un*x systems can hook their system's IP stack straight into the radio (Linux has a kernel AX25 system, thanks to GW4PTS) which makes life a little easier, but the majority of people use NOS (KA9Q's package, or one of its derivatives) under MS-DOG or on their Amoebas/Macintoshes/etc.

As far as connectivity is concerned, AMPRnet is NOT a well-connected network. IP activity on packet exists in isolated areas rather than there being a well-connected worldwide network. The not-particularly-real-time nature of packet radio makes this inevitable, unfortunately :-(
It may sound weird that there's a Class A network which is split and fragmented all over the world, but that's just the way things have evolved.

That said, connectivity to the rest of the Internet can be achieved provided that someone's set up a gateway. Often a local university will be happy to oblige (if you supply the kit!), or someone else will set up a mail-only relay. You'd find that access was slooww, but it'd work, and it does work regularly all over the place. Remember though that virtually all 44.0.0.0 addresses cannot be reached through the Internet, so you'd need a reachable network first...

Basically, yup, it can be done!

PMS = Personal Message System. Like a BBS but used by just one person for
handling their personal mail.

BPQcode = G8BPQ's network system (i.e. node code!) for MS-DOS machines.
Runs as a TSR on an MS-DOS machine and provides level 3/4 services
to users, as well as being a front-end for most BBS software
such as FBB/NNA/whatever.

582. Re: Texas instruments DSP starter Kit

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-02-28 20:03:14 UTC
From: hunter@s07.es.llnl.gov
Message-ID: <2ktim2$8j5@lll-winken.llnl.gov>
Source record: 50127

I have one of the TI DSP Startter kits. It uses the TMS320C26BFN DSP chip. There is a little
software that comes with the unit and more that is available from their bulletin board.

You get the board, an assembler, simulator and debugger. The board includes a 12-bit A/D and
12-bit D/A on board as well as a serial port to connect it to your PC. The unit requires a 9VAC power source or you can solder wires to the board and use a +/- 8-12VDC power source. This
will void your warranty of course.

I haven't had time to run many of the experiments yet. There is a lot of info and examples in the TI Application books (3 volume set) but I don't feel like typing them in and I have been unable to load some of the examples from the bulletin board.

Note that the software must be written in assembly as the C compiler won't work with the Starter Kit.

This is probably as inexpensive a start into the world of DSO as one can get. It is probably
a good value despite its limitations.

Steven Hunter

583. ANOS source help needed!!!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-02-28 20:36:47 UTC
From: "Alan K. Adamson" <aadamson@symantec.com>
Message-ID: <2ktkkvlNNhht@grumpy.symantec.com>
Source record: 50128

All,

I am starting a very ambitious project. I am trying to put together a
NEW version of anos for ax.25 tcp. In doing so, the only source that
I can find it anos29K. I am currently using version "n" from John.
So the problem. 1) I can't seem to get "k" to compile with a new SAS
C v6.5 compiler. Actually, I can get it to compile, but it wont run.
2) I would much prefer to undertake this project with the "n" or newer
source. Does anyone have any information on whether there are bugs in
the "k" source or if there is a newer version avail somewhere.

I would really like to add some of the great things in JNOS to this
code stream, but can't seem to get a good version of source that I can
compile in a known working state. Anyone that has done so please advise.

I have the source to x16 of JNOS and would like to put convers, etc.,
into anos. Any interested parties should contact me at this address
for more information.

But I have to get to first base....

I have sent numerous emails to john G1YYH, but I'm not sure they have
made it, as I have received no response. I sent another one today,
we'll see. So I ask, has anyone else compiled and ran a version of
anos?

Thanks,
Alan Adamson

>frequency so the 1watt limit may not apply to us.

Hams can use 1500 watts on the 902 band, provided no interference is
caused to primary users. Part 15 devices are not primary users.

That said, remember that if you crank the wavelan boards up past 1
Watt, you must meet part 97 rules. These devices ARE spread spectrum.
The part 97 rules for this technology are restrictive, though I think
stepwise is allowed, and I think that's what is being used. Next rule
to worry about is identification. Some means of working callsigns in on
a regular basis would be needed. Finally, remember that CONTENT rules
(no swearing) and BUSINESS rules (no business messages, no forsale
messages except for radio gear) and so forth all apply.

Because of these things, hams might consider running wavelan under part 15,
rather than part 97.

Compression is not an attempt to hide content. Compression is done to
efficiently use a channel, not to obscure meaning. If the FCC wants
your compression scheme, all they have to do is ask (and you better
be ready to give it to them :-).

586. APRS operations on 145.79???

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-03-01 05:52:41 UTC
From: russell@spdcc.com
Message-ID: <CLz1nv.2sn@spdcc.com>
Source record: 50131
Cross-posted to: rec.radio.amateur.space,rec.radio.amateur.digital.misc

Hello all,

Recently, amateurs in the Omaha area where I live have been looking into
getting an APRS network set up, and one thing that's been a concern of
several people (myself included) is the fact that the "standard" frequency
that is being used for APRS is 145.79 mHz.

This seems to us to be much too close to the 145.80-146.00 satellite
band, especially given the fact that APRS is designed for wide-area operation
and people will probably be running some high-powered digipeaters, at least
on a temporary basis for special events and probably on a permanent basis.

It has also been mentioned that this frequency falls in a subband that
has been suggested for experimental uses, and a permanent packet network
based on established AX.25 protocols hardly seems experimental.

What do you think? Are we being paranoid, or is it just that APRS
isn't popular enough for people to have noticed? I'd like to see this
discussed before people sart putting up fixed-frequency remote digis, etc
that will be VERY hard to get moved. APRS looks like a great system, and
I think it does need a coordinated frequency, but I don't think 145.79
should be that frequency.

The canadian rules are realy very flexable on spread spectrum. I know in the US you have to use AX.25, and are only allowed I think its 3 spreading keys, and that puts a real kink in any plans to use the wavelan stuff under the HAM rules at higher powers. We have no such limitations here in canada, as long as we stay in the band by 26dB (correct me if the number is wrong.), and ID every 30 minutes.

Having said that, those boards are in my opinion a bad choice. 902-928 is a shared band, and if you crank up the power even with narrow beam antenna, you are likely to interfer with something (like another wavelan, or possibly one of those new cordless phones). Besides, weak arguments about possibly interfering with someone else aside, those things are NOT amateur. Check out the ARRL handbook for a neat design for a 10GHz design that's MUCH cheaper, will not bother anyone, and is easy to build. It goes up to 10MBps!

The US rules do not limit data format. AX25 is *not* required. A common use for SS is digitized voice for example, a continuous data stream. We can transmit any digital data we wish, subject to content limits, but we are limited to only certain spreading sequences, or hopping patterns, and we must ID in a narrow band detectable mode every 10 minutes just as with any other amateur transmission. This pretty much kills the Wavelan cards for amateur use, however, since they aren't designed to switch to a narrow mode on command.

Normally you would mix a LO with the ~ 300 khz to get say, a 50 khz IF,
then use something like a EXAR 2211 FSK demod to recover the data.

Or, use a phillips 615 (NE or SA) to do the mix, lo, and demod, all
on one chip.

I have built one and have a second partially complete. You would certainly
do better buying a TNC instead. DSRI has some with 9600 built in, and so
forth. The biggest advantage I see with the TAPR modem is the ability to
do bit regen, but that is only an issue for your full duplex packet
repeater, not for user equipment.

Packet BBS operators, users and high level net-rom nodes directed toward
the BBSs have used the 145.790 MHz frequency here in Northern California
for several years. I agree with you that stations with excessive deviation
could be operating with their sidebands into the adjacent satellite band.
Care should be taken to set proper deviation. Your group might want to
hold flea-market clinics to demonstrate the principles. Most fellows are
overjoyed once their rigs are properly operating! A lot fewer retries!

Northern California operates digital modes on 145.71 .73 .75 .77 and .79
in addition to the 144.91 .93 .95 .97 .99. 145.01 .03 .05 .07 .09 and 146.58

Unfortunately, cross boarder operations are forbidden to us. 97.311(a)
limits us to communications between points that are regulated by the
FCC. Last time I looked Canada was still an independent nation. :-)

>: A common
>: use for SS is digitized voice for example, a continuous data stream. We

>
>Just so I don't have to go hunt it down, what ARE the (3?) spreading codes
>allowed in the U.S.?

97.311(2)(d) The only spreading sequences that are authorized are from
the output of one binary feedback shift register (which may be implemented
in hardware or software).

(1) Only the following sets of connections may be used:

Number of stages Taps used
in the shift register in feedback

7 7,1
13 13,4,3,1
19 19,5,2,1

(2) The shift register must not be reset other than by its feedback during an individual transmission. The shift register output sequence must be used without alteration.

(3) The output of the last stage of the binary linear feedback shift register must be used as follows:

(i) For frequency hopping transmissions using x frequencies, n consecutive bits from the shift register must be used to select the next frequency from a list of frequencies sorted in ascending order. Each consecutive frequency must be selected by a consecutive block of n bits. (Where n is the smallest integer greater than log2(x).)

(ii) For direct sequence transmissions using m-ary modulation, consecutive blocks of log2(m) bits from the shift register must be used to select the transmitted signal during each interval.

Well, whomp there it is! Clear as mud isn't it? As you can see, though there are only 3 allowed sequences, there are many possible frequency tables for hoppers, and each station can be in a different part of the sequence during a transmission. So more than three stations can share the band at the same time. For direct sequence transmissions using the same m-ary modulation, only transmission timing differences, and center frequency, exist to separate stations. But that's sufficient to allow many stations too.

Gary

597. EMAIL to mid-ocean?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-03-02 09:07:33 UTC
From: walker@sappey.GRenoble.hp.COM
Message-ID: <9403020907.AA11103@sappey.grenoble.hp.com>
Source record: 49892

|Subject: EMAIL to mid-ocean?
|
|
|Hi,
|
|I originally posted this to a defunct group, so here goes again...
|
|Please forgive me if this is a stupid question - although I'm a communications
|engineer, my knowledge of amateur radio is weak, and I will not be an
|amateur until the end of this year (if I pass my exams).
I'm sure you'll get the same answers from all angles, but here goes anyway...

First of all remember the licence conditions: AN amateur licence is issued to
permit EXPERIMENTS IN RADIO ELECTRICITY, not to permit the establishment of
a communications network!!!!! (This is true in all countries! :< So...

1. What sort of info do you want to pass???? Amateur bands are NOT allowed to
pass personal info (estimated arrival time, boat needs etc...).
That should all pass via the public (paying) services...
If you just want to make the contact (in the true Amateur spirit) then
your idea is quite simple...

1. Get a packet node controller (Terminal Node Controller - TNC) to link
the Computer and Radio.
2. Identify a packet node that the marine station can contact, where both
parties can leave messages.
3. Identify an internet-amateur gateway where you can send messages from
your internet system.
4. Unless you are close, forget direct contacts...

1. Internet - to - Amateur Email: the same problem exists at all gateways
between internet and Amateur packet: how do you filter the contents?

2. The Marine VHF and HF voice services exist in a reasonably reliable form:
If you really want to use digital comms, then perhaps try using regular
telephone modem connections via the marine services?

3. A reliable high-quality data link is easy to build. Add satellite
links for complete global coverage if you want. The only problem is that you
need to be allowed access to a frequency (paying of course), and also
pay a lot more money to the professional service provider...

3. Suggestion if you want direct contact for personal messages, remember the
that the 27Mhz CB service is free for any non-commercial use.
27 Mhz Single side-band equipment is cheap, robust and of reasonable quality.
Content of messages is NOT restricted as on the amateur bands...

As 11 meters (27Mhz) is an HF band, you can have intertcontinental
contacts. A boat in international waters is not resticted in power, and the
normal HF rig they have on the boat can probably access 27Mhz.
Perhaps you could use packet on this band and so have the liberty to say
what you want.

Don't expect to find any other packet stations or any link to
internet on 27Mhz.

|
|The question: Members of my family live on a yacht, currently heading from
|Costa Rica to Hawaii. The boat is small, and has limited power, and we are
|already having trouble on HF receiving them (a ham in the North of England is
|the current point of contact).
|
|Now, I use EMAIL via Internet and X.25 every day, and it occurred to me that
|this should not be impossible from a small boat (they already have a laptop).
|They are obviously experienced hams, but have no knowledge of networks. I was
|therefore wondering if there is a practical *cheap* ($100s, NOT $1000s) way
|to enable EMAIL via their HF ICOM rig to Internet addresses, and vice versa.
|The "network" would then provide the delivery mechanism, rather than trying to
|rely on brute force (which we don't have).
|
|Is this a daft idea? Have people done this before? Are there simpler ways
|of achieving the same ends (apart from paper mail ;-)?
|
|All thoughts are gratefully received. Thanks!
|
|Nick nick@nick01.demon.co.uk
|PS. Please remember that I am not yet an qualified amateur, and my knowledge
|of cryptic mnemonics will not match yours!

598. Interface for Jvfax pcb part1

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-03-02 09:28:02 UTC
From: boyer@rd.eng.bbc.co.uk
Message-ID: <CM16Ar.FM7@bbc.co.uk>
Source record: 49893

I persuaded a friend of mine in our DO to draw up the Jvfax interface and
do a pcb layout. it is single sided and there are jumper wires that have
to be added. I haven't built it yet, as I'm waiting for the bits to arrive
in the post. However it has been checked by two people and we cant see any
errors. If any spots errors please let me know and I'll get the board up
dated.
Well here is the pcb in postscipt form.
You might have to do a dos2unix conversion this is a dos file.

599. Interface for Jvfax pcb part2

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-03-02 09:32:38 UTC
From: boyer@rd.eng.bbc.co.uk
Message-ID: <CM16IF.Foz@bbc.co.uk>
Source record: 49894

This is the overlay for the jvfax interface. It includes the wire jumpers
(thick lines). The same is true about file formats. Have fun and please
let me have some feedback.

WRONG!! The major difference is in who may originate a message and to whom

you may communicate (only other *US* CB licensees). Rule 95.405 lists very
specifically the areas where operation is permitted.

> As 11 meters (27Mhz) is an HF band, you can have intercontinental
> contacts.

No, legally you *CANNOT* have international contacts. A US CB CLass D
permit
is only valid within the borders of the USA and allows communications ONLY
with other US CB licensees within 155 miles (250 kM) of the station
(95.413 a 9). It does not allow for international contacts in any fashion,
except for contacts inside the above mileage limit with GRS stations in
Canada (95.413 a 11)!

The 27 MHz band is NOT allocated for general unlicensed or unrestricted
usage in international waters. Vessel operators are required to abide by
the maritime communications rules of the country in which their vessel is
registered or owned, as well as all applicable international treaties and
agreements between various countries.

> A boat in international waters is not restricted in power, and

True, but you cannot operate on the 27MHz band if you are aboard a US
vessel in international waters, only within 50 miles of the borders of
the territories listed in 95.405a and must comply with FCC rules at all
times, including the 4 watts AM or 12W SSB output limitation.

> the normal HF rig they have on the boat can probably access 27Mhz.

Of course this violates the FCC Rules (95.603 c) which require type
acceptance of ALL transmitters in the Citizens Band

> Perhaps you could use packet on this band and so have the liberty to say
> what you want.

WRONG AGAIN, TIM! One more time, please read the FCC Rules, Part 95.
The Class D service is limited to voice only (95.412 b and 95.627) ;
tone and data transmissions are strictly and specifically prohibited.

>
> Don't expect to find any other packet stations or any link to
> internet on 27Mhz.

At least Internet abides by the FCC Rules (so far). Let's hope that it
stays that way well into the future.

Message-ID: <1994Mar2.153334.23356@mixcom.mixcom.com>
Source record: 49897

I'm am interested in the high-speed digital modes (1 megabit packet) and Spread Spectrum. I've done a project or two, but am looking for others with similar interests. Would QEX be a good magazine to subscribe to? If I only see such articles once or twice a year, I don't want to bother. Then again, $12.00 for ARRL members isn't bad at all!

603. Baycom modem

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-03-02 15:39:00 UTC
From: jangus@skyld.grendel.com
Message-ID: <762622740snx@skyld.grendel.com>
Source record: 49898

Please help, how can I connect my digicom modem to the telephone network.
It won't respond to the AT commands.

Does anyone have a (free) phone number I can connect to packet with?

Serdar Argic

i am an amateur because do not wish to see any professionals suffer

604. Email address for ARRL?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-03-02 16:00:10 UTC
From: brianm@boi.hp.com
Message-ID: <2l2d6a$b4n@hpbs3591.boi.hp.com>
Source record: 49899

Hi folks. Does anyone know the email address for the ARRL. I know they are on the net, but have not been able to get an address for them.

Fingering @arrl.org was no help.

I hope this isn't an FAQ, but I couldn't locate any FAQ list here or on UCSD.EDU.

Thanks & 73s .....Brian

Does anyone have the AX.25 spec they could email me. I have looked
in several places on the Internet, but could not find it.

Thanks & 73s .....Brian

Hello to All,
I have a Pac-Comm Micropower-2 1200 baud TNC. I would like to
install a 2400 baud modem into the TNC. When I called Pac-Comm they told
me they do not sell a 2400 baud for the unit.

I purchased an MFJ-2400 modem, of course MFJ does not guaranty the
compatability of this 2400 buad modem with the Pac-Comm TNC. However,
looking at manuals, it looks like by cutting the Receive data (pins 17&18),
Transmitter clock (pins 11and 12) and the Receive clock (pins 13 and 14)
traces on the MFJ Modem header connector and connecting the MFJ-2400
modem header connector and it will work. Does this sound correct?

Has anyone else out there done this?

Any guidance and insight will be appreciated!

Thanks.
Dan Flynn ww3n

I don't want to do a Westlaw search on this, but in the last round of the pornography hysteria there have been a whole bunch of regulkations issued about "indecent" speech. Not tested in court as far as I know, but (IMHO) the really objectionable part is an attempt to extend this to private telephone conversations.

This subject is often debated on soc.motss since these laws are often used to harass homosexuals in various ways. Sorry I don't have any more specific references to cite right now.

> The FCC has ruled that broadcast radio transmissions, including amateur,

This indeed was the rule until circa 1991.

> Common carrier and
> voluntary private conversations and correspondence fall under the
> area of protected speech. Public utterances and writings fall under
> varying sets of restrictions depending on where, when, and how they
> are made. The FCC's "broadcast" interpretation is the strictest of
> these limits.

Those who would protect our tender ears from such things delight in pointing out that the first amendment is not absolute and that truly

"protected speed" only applies to "legitimate" political debate. In practice this often means subjects approved by those in power. For example the "man boy love association" and the harrassment they have received for trying to voice their views. (Not that I think they have merit, but they are supposed to have the right to expressthose views).

I really don't want to get into a Libertarian debate here, I will leave that to those who have a burning interest in suchthings (see my .sig - I really mean it :-)

> Well, whomp there it is! Clear as mud isn't it?

What the rules don't make clear is that shift registers in various combinations can generate some interesting sequences which don't repeat for a very long time. The ones allowed by the rules are "short sequence" codes which repeat fairly often, thus it is not difficult (comparitively speaking) for the FCC to find and monitor the transmission.

Last time I studied the question (>15 years ago :-), the publically available theory wasn't very helpfull in predicting the lengths of the sequences and their "randomness". Still an interesting area for "tinkering".

> 1. What sort of info do you want to pass???? Amateur bands are NOT allowed to
> pass personal info (estimated arrival time, boat needs etc...).

I'm not sure just what set of rules "Walker Tim" is reading, but they are
not part 97 ofthe FCC rules!

"personal" communication is indeed permitted and has recently been
liberalized in the US.

"business" communication is not permitted, nor is simply bypassing a
landline telephone. From your original post, though I don't think this is
what you have in mind.

Such things as telling freinds/relatives your ETA have always been allowed
in the US, ordering food (e.g. Pizza) is now explicitly permitted, ordering
boat parts for your private pleasure boat should also pass muster.

Passing the ETA of your oil tanker to head office is clearly "commercial",
as is transacting any type of "occupational" information. Arranging to
meet your charter group would also seem to be "commercial".

The FCC has deliberately been somewhat vague about exactly what is allowed
and what is not to allow amateurs to "self-police" things which reasonably
should be OK from things which pass the "letter of the law" but are really
commercial communication.

> 1. Internet - to - Amateur Email: the same problem exists at all gateways
> between internet and Amateur packet: how do you filter the contents?

As far as I know all the gateways require the originator to be a licensed
amateur.

> 2. The Marine VHF and HF voice services exist in a reasonably reliable form:
> If you really want to use digital comms, then perhaps try using regular
> telephone modem connections via the marine services?

Clearly "Walker Tim" has never tried to use these services from a remote
location :-)

In an emergency it is often easier to contact someone on the ham bands than marine bands just because there are so many people listening from so many locations. You don't need to study HF propagation as your boat is sinking!

> 3. A reliable high-quality data link is easy to build. Add satellite
> links for complete global coverage if you want. The only problem is that you
> need to be allowed access to a frequency (paying of course), and also
> pay a lot more money to the professional service provider...

Between $10K and $500K, just a little steep to tell Aunt Martha that you are coming to visit.

> 3. Suggestion if you want direct contact for personal messages, remember the
> that the 27Mhz CB service is free for any non-commercial use.
> 27 Mhz Single side-band equipment is cheap, robust and of reasonable quality.

Well maybe the *equipment* is, but at least in marine use 27Mhz is essentially useless. Operation within the jurisdiction of another country is rarely allowed.

To get email from mid ocean I would get a new terminal node controler
and use PACTOR to link up with one of the PACTOR bbs on 20 meters. Pactor
is a far more robust digital mode than rtty,packet or AMTOR. For
communications from mid-ocean it is hard to beat the maritime mobile net
on 14.313 in the afternoon. I forget the times. There are some really
BIG guns on that can pull almost any thing out. Some one should be able
to relay this to the internet or ham packet nets.

617. Making a low-power radio transmitter

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-03-03 02:04:08 UTC
From: acarhart@netcom.com
Message-ID: <acarhartCM2GEz.DI2@netcom.com>
Source record: 49912

I want to make a low power radio transmitter, but need help
on how to do it...my general model is as follows:

```
|-------|C|---------|
= | ______ /
(A/C) - $ | | /
= $ $ XXXX
| $ |-----| \
| | \
-------/\/\/R\/\/----
```

where |C| is a capacitor of value C, $$$ is an inductor of value L,
$ is a smaller inductor (amounting to a transfer between the two, correct?)
XXX is just a wire, and \ / is an antenna
\ /

(and /\R is a resistor of value R)

the w(omega) angular frequency is 1/sqr(LC)
so am I on the right track? with the right values of L and C
can I come up with a frequency (I know about the 2*pi factor)
equale to 100 * 10^6 Hz (100.0 on FM)
and then how do I make it something meaningful?
FM means frequency modulation...should I change the frequency
with a microphone?
I was thinking that one side of a capacitor could be movable....
attached to a permanent magnent to repel or attrach an electromagnet
(whose magnetic strenth and direction would depend on a microphone)

This would cause one of the plates (of a parellel plate capacitor)
to come close or further from the other, make the C value larger of
smaller, thus making the frequency smaller or larger...
am I on the right track?
please note that I derived all of this from the very basics
in a 3rd-quarter college course physics class, discussing
electromagnetic waves.
Please tell me iff I am on the right track (that a misspelling...not if and
only if)
and tell me what I would need to do to broadcast my voice (low power)
to a radio sitting next to me.
Tell me if this is not the right newsgroup.
please email me as I am new at reading newsgroups!
thank you.

Cross-posted to: comp.os.linux.help,rec.radio.amateur.digital.misc

I installed the ax25 patch and compiled a pl15 kernel for my
machine. I tried both the pl15 kernel available on funet.fi
and the pl15h I found here at school. When I boot and try
to do an axattach, I get an error that looks something like:

SIOC(something,something): Invalid argument.

It's the same kind of error I get when it can't find the
ethernet card. I haven't installed the driver for my
ethernet card yet so I don't know if that will fix it.

Does anyone know what kernels the ax25 patch works on, and/or
what I'm doing wrong on this compilation?

TIA,

The Netherlands, March 3, 1994.
Hello dear reader,

Today I distributed the file NET_Mac2.3.38.sea.hqx...

In this version of NET/Mac I implemented the following:

- Added Text Capture FKEY-support for split-window sessions
- Removed a mod that generated faulty From-addresses

This version obsoletes all versions of info-mac/comm/net/radio-netmac in
the Sumex-Aim archives.

The new NET/Mac has (hopefully) been uploaded to:
1) ucsd.edu, to the directory hamradio/packet/tcpip/incoming.
If it's not there then look at hamradio/packet/tcpip/mac.
2) ftp.std.com, to the directory pub/hamradio/mac/packet.

Kind regards,

Adam PA2AGA (e-mail: adam@gg.tno.nl )
( or: pa2aga@gg.tno.nl for letters only, NO BIG files here)

621. AX.25 and Linux - my experience

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-03-03 16:53:58 UTC
From: chardi@cs.man.ac.uk
Message-ID: <1994Mar3.165358@cs.man.ac.uk>
Source record: 49916
Cross-posted to: comp.os.linux.misc,rec.radio.amateur.packet,rec.radio.amateur.digital.misc

Hi,

A few days ago I posted a question about AX.25 and Linux - various people asked me to post my findings, so here goes. Please don't have a go at me re: my lack of knowledge of the Linux kernel; although I've been Linuxing for quite a while, my knowledge of the kernel is fairly limited.

This is how I got KISS encapsulated AX.25 TCP/IP working on Linux 0.99-pl15. Note that some of this is conjecture; i.e. it seems to work :-)

1. ftp the AX.25 patches from sunacm.swan.ac.uk:/pub/misc/Linux/Radio/AX25012 (there may be a later revision than 12).

2. Unpack the new files in the Linux source tree - there are a few in net/inet, and one in include/linux.

3. Do a 'mknod /dev/af_ax25 c 30 0' (I don't know if this is actually necessary).

4. Edit drivers/net/slip.c. Search for ax25_test, and change the callsign therein to your own. For example, for my call (G7OMZ-5):

```
static char ax25_test[7]={'G'<<1,'7'<<1,'O'<<1,'M'<<1,'Z'<<1,' '<<1,'5'<<1};
```

5. The next bit is quite hacky. There is an implementation of KISS encapsulation in slip.c, but by default it isn't enabled. I couldn't figure out how to make a SIOCSIFENCAP ioctl() call (I didn't know what to give it as a file descriptor), so I just hard-wired it to set all SLIP channels to SL_MODE_AX25 in sl_initialize(). Of course, this won't do if you use SLIP for anything else, so you'll have to hack around in slip_init(). There's a call to sl_initialize() in there, so you'll have to test for certain interfaces and set SL_MODE_AX25 accordingly. I don't know enough about the kernel to comment.

6. Edit config.in, and search for CONFIG_PLIP. Add a line above it:

```
bool 'AX.25 (KISS) encapsulation support' CONFIG_AX25 y
```

7. make mrproper ; make config ; make dep ; make zImage, then install the new kernel as per usual and reboot. Fingers crossed!

8. When the system comes back up, create a file containing the following commands:

```
port ttyS2
speed 9600
term
local 44.131.1.254
remote 44.131.1.57
mode SLIP
```

Replace ttyS2 with the port your TNC is connected to, and the local IP address should be your own. The remote IP address should be either the nearest neighbour through whom you want to route, or your local subnet (mine is 44.131.1.0).

9. Type 'dip filename'. You'll be in terminal mode with your TNC. Put it into KISS mode (usually 'kiss on') and type a ^]. This should set everything up for you.

10. If you type /etc/ifconfig, you should see two messages; one for the loopback device 'lo', and one for 'sl0'. If you type /etc/route, you should see that there is now an entry for 'sl0'. You can either make this your default router (as you would do if there is an Internet gateway nearby) with:

/etc/route add default gw 44.131.1.57

...or (more likely) you will only want to route ampr.org packets through it, which will look like:

/etc/route add 44.0.0.0 gw 44.131.1.57

11. That's it! You can now add those commands to your /conf/net/rc.inet[12] files to set it up at boot time.

Cheers,

Ian.

: : I hope this isn't an FAQ, but I couldn't locate any FAQ list here or
: : on UCSD.EDU.
: : Thanks & 73s .....Brian

: For us, arrl.org is an unknown host. Therefore, email to
: info@arrl.org
: goes nowhere. Is this the correct host name?

The unknown host is the reason fingering was no help. I should have this
added important point to my original post 8^(.

Our DNS server can't seem to make any sort of resolution about it either.
After setting the default server to NS.PSI.NET nslookup was able to come
up with the following, but no resolution for arrl.org!

```
*************************************************************************
Default Name Server: NS.PSI.NET
Address: 192.33.4.10

> arrl.org
Name Server: NS.PSI.NET
Address: 192.33.4.10

arrl.org
origin = ns.psi.net
mail addr = hostmaster.ns.psi.net
serial = 199311301
refresh = 7200 (2 hours)
retry = 900 (15 mins)
expire = 2592000 (30 days)
minimum ttl = 86400 (1 day)
arrl.org nameserver = ns.psi.net
arrl.org nameserver = ns2.psi.net
arrl.org preference = 5, mail exchanger = mgate.arrl.org
arrl.org preference = 10, mail exchanger = uu7.psi.com
ns.psi.net internet address = 192.33.4.10
ns2.psi.net internet address = 192.35.82.2
mgate.arrl.org internet address = 38.1.219.1
uu7.psi.com internet address = 38.145.204.6
*************************************************************************
```

I don't know what the problem is. Maybe a DNS guru can point something out?
I haven't yet tried to mail something so I don't know if this resolution
trouble is going to cause me grief now that I have the addresses for the
arrl.org folks.

Donald Jeff Dionne (jeff@ee.ryerson.ca) wrote:
: For us, arrl.org is an unknown host. Therefore, email to
: info@arrl.org

That's because arrl.org is not a host, it's a mail address.
If you use nslookup like so:

nslookup -query=MX arrl.org

You'll find out all you need to know, including the fact that ARRL
mail is handled by hosts mgate.arrl.org and uu7.psi.com, in that
order of preference.

If your system is for some strange reason unable to deal with
standard mail addressing via DNS (i.e., MX records), you can
use @mgate.arrl.org instead. Presumably you system can resolve
that!

>what others use????
>Your help appreciated.
>Alan
>N1QWT

THS was written to use the WA8DED host mode. It was written by HB9CVV and,
to my knowledge, is not available by ftp anywhere. It is available from TAPR
on disk, as is SP, another DED host mode program by DL1MEN. You can get
the latest tapr disk list and ordering information from the tapr file server
by sending a message to file-request@tapr.org with the following lines:

get /pub/tapr/taprdsks.txt
get /pub/tapr/pricelst.txt

If you want additional information about the file server and what is
available, add the lines

help
dir

It is a good idea to put a line at the end:

quit

TAPR also sells a KISS eprom for the TNC-1 as well as a
modification kit to improve the DCD action of the XR2211
demodulator.

The address is correct. Your system is not handling MX records properly, I would guess. Ask your friendly system administrator. Using nslookup, set type to MX, and try arrl.org. You should get a response showing you who handles mail for arrl.org. Your mailer is supposed to automatically do this lookup and push the mail along.

Release Notes - IM/Mac 1.0=A727y

- The numbers in the option-about dialog are now correctly formatted =
for all
languages.

- Beachball cursor stops spinning immediately after finishing updatin=
g mail file
when quitting.

- Beachball cursor stops spinning when a system error occurs.

- When a system error occurs, the dialog that shows has a 'MacsBug' b=
utton when
MacsBug is running. This will create a file called 'crash_log' whic=
h you need
to send me.

- Files with filetype 'ZSYS' and creator 'MACS' (e.g., 'VM Storage') =
can no
longer be send. They're treated as invisible files like the Finder =
does.

- When selecting a file to send, the text inside the outlined button =
was 'Send'
instead of 'Open' if the target was an alias to a folder.

- When the last item (Record) in the "Edit 'bm.rc'=C9" dialog contain=
ed only a
filename, a system error occured. The syntax for that line is as fo=
llows:
[[[:<volume>:]<folder>:]<file>]. Square brackets enclose optional ite=
ms.

Examples:
:My Hard Disk:My TCP/IP Folder:spool:Archive:Sent Mail
spool:archive:sent mail
archive

- Finding out if MacsBug is installed via Gestalt doesn't work. Used =
another
method.

- Sending a file that needs to be BinHex encoded will have its name t=
runcated to
27 characters to make room for the '.HQX' suffix in the subject tit=
```

le. The
original file name will reappear after the BinHex decoding takes pl=
ace at the
receiver's end.

- Deleted mail icon was 1 pixel too high.

- Does stuff/unstuff of files on system 7 Macintoshes that have 'Stuf=
fIt
Engine=AA' (version 3.0 and higher) in the Extensions folder. Files=
that were
compressed/made with StuffIt, Compact Pro, AppleLink, DiskDoubler o=
r
UpdateMaker won't stuff twice.

- Beachball cursor kept spinning when a system error occured during B=
inHex
encoding.

- On popular demand:

The problem is _probably_ that there is not a machine named arrl.org.
Looking at the output of nslookup that you provided, email for anyone
at arrl.org should be sent to the host named mgate.arrl.org. If you
fail to talk to that machine, you can try uu7.psi.com.

Your problem with mail is probably that you're running a SunOS box
or another mailer that doesn't understand MX (mail exchanger) records.

If you are on a SunOS box, replace the file /usr/lib/sendmail with
/usr/lib/sendmail.mx. Why they don't ship SunOS with the MX aware sendmail
the default is beyond me...

Hope this helps.

Has anyone figured out how to connect a Baycom/Poor Mans Packet circuit
to a Tandy Model 100?

I just finished building a Baycom modem for packet, and I'd just love
to be able to use my portable, non-MSDOS compatible Model 100 as a terminal
to at least receive those packets.

Actually, we've been trying to get the Model 100 to decode the signals directly
through the cassette port. All we've been able to do is CW so far. RTTY
is next, unless someone has cracked that nut already ...

Thanks,

Mark KB2els

```
Serdar, a digicom modem WON'T work on a phone line. It is
only for sending and receiving packets from a radio. It has
no onboard processor to execute any commands. It will
not work with the usual communicatios software on a PC, like
Procomm, Telix, etc. It needs special software to operate.

Hello, does anyone know where I can ftp. the newes version
of TPK, witch would be version 1.84. I already have
versio 1.81. I am told that the support for BPQ is
mutch better and the mail interface with the FBB BBS in the
new version.

So please e-mail or post if you know where to find TPK 1.84.

Hello. I am on a 386 Bsdi 1.0 unix box using vt100 terminal emulation.
The system I am using used to be under System V and there were no
problems with telnet to places like wa7slg.ampr.org.
Now, under Bsdi, however, when I hit enter I see the ^m. Also, when
sending commands to packet nodes like the r command for routes I get an
invalid command. I have a feeling that my enter and other commands are
no longer processed right. Any suggestions? Thanks. 73

If you use telnet to connect to a remote NOS station, then type ^] to escape
to the telnet prompt. Then type: mode line and everything should be fine (your
mileage may vary of course).

642. Good Windoze programs?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-03-06 18:20:30 UTC
From: Henry Wertz <Henry@chop.isca.uiowa.edu>
Message-ID: <762978212-0-22669@chop.isca.uiowa.edu>
Source record: 49937

Sorry to dissappoint you, but good programs at all, let alone shareware, are impossible under Windows.. A good program is fast, efficient, and doesn't always crash. This is impossible under Windoze, because Windoze by it's very nature is slow, inefficient, and often crashes.

643. need ssb packet radio info

I want to use marine ssb to transfer files between 2 vessels. Each vessel would be equiped with a PC, radio modem, software and SSB transceiver. I am looking for reccomendations on how to get this to work. This would be for commercial use, so this may not be the best place to post this request. Any info anyone can provide would be appreciated, such as books, magazines, ftp sites, or products that may be available.

644. Info needed on Tandy 4000

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-03-06 22:22:07 UTC
From: twright@freenet2.scri.fsu.edu
Message-ID: <2ldl2f$aue@freenet3.scri.fsu.edu>
Source record: 49992

This is sort of a cross post but I am in need of an answer.

I bought a Tandy 4000 from a surplus computer sale here at the
University where I work.

It has a 3 1/2 and 5 1/4 drives min of a 40 meg HD EGA monitor
a 2 MEG RAM CARD. Paid $25.00 for it because both the monitor and
CPU units were marked NO GOOD by the University service people.

I thought well if it doesn't work I can always use the case to build
a computer system. Well I took it home connected it up, turned on
the monitor and it appeared to be working fine complete full rasper
on the screen. TYhen I powered up the CPU. The boot up information and
the C> prompt over lapped in three columns (running DOS 5.0)
I loaded Super Morse and the data on the screen still over lapped.
I loaded it off both floppies and the system worked just fine except
the monitor. I then loaded a game called Space Quest II and the
problem on the monitor cleared up. I reinstalled SM to verify problem
still existed and yes it was still there. I then connected the monitor
to another CPU and the monitor worked perfectly.

I believe the problem is with the Dos 5.0 system program in the
video drive cmd section. What leads me to believ this is that a
Game like I loaded runs off its own internal programing and the video
driver cmds are being taken from the game program and not the system
program.\

If you think I am correct or not Please E-Mail me I want to get this
system on line on Packet A.S.A.P.

Thank a bunch

Tim Wright KD4OVM

BTW All of the drives are working perfectly also.

646. Food For Thought -- The BBS Network

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-03-07 14:40:53 UTC
From: jra1854@tntech.edu
Message-ID: <01H9ONHUM7V6F4EC48@tntech.edu>
Source record: 49990

Here are a few observations on improvements needed to the BBS network. I hope that this generates some discussion of these problems which will lead to solutions.

BBSs have no priority mechanism for distingushing between bulk mail (bulletins, etc.), normal mail and priority or emergency mail. In an emergency environment these distinctions must be made and the messages queued appropriately. There should be a mechanism to forward priority or emergency mail immediately and to limit the rate of or suspend the forwarding of normal mail and bulk mail. Priority designators should be compatible with or mappable to NTS designators and any other applicable designators; the mapping should be well defined. This capability should be added to the BBS software and should be controllable by remote sysops.

There is a schism between the SMTP (TCP/IP) addressing and the BBS addressing mechanism: neither form is compatible with the other. Additionally, some forms of the BBS addresses look too much like Internet addresses (for example, NA and SA are valid Internet top-level domains). This makes it difficult for systems running both BBS and TCP/IP to handle mail. The creation of an addressing system which is compatible with the Internet (and with OSI?) addressing should be explored; if compatiblity is unobtainable the BBS addressing system should at least coexist with little confusion and operational difficulties.

Personal messages (one-to-one) and bulletins (one-to-many) are too interemixed. There should be a separation of these two functions at the protocol and addressing level, even if they are combined at the user interface.

Bulletins are nearly impossible to manage, especially if one tries to organize them in some logical fashion. Standardized names for bulletin groups should be established with allowances for the addition of local and regional groups. MIDs, BIDs, and other IDs need to be clarified and possibly simplified. BIDs should be expanded to be compatible with that used on the Internet so that newsgroups can be gatewayed at multiple points while avoiding duplication of bulletins.

BBS message interchange protocols are poorly documented. (This is being worked on by W0RLI and others.)

Macintosh Amateur Radio Software - March 1994
Version 1.06

Please feel free to distribute this list as widely as possible. Many of you have asked if it is OK to cross-post this list? I don't mind, but I would like to know where it is going. If you think it should be cross-posted to other USENET groups, please let me know so I can try and manage these. We don't want to have any duplication or our welcome will be wore out! I will also try and honor individual requests for this list... but I do not always catch all of the newsgroups postings... so please DO NOT reply/ask there! If I am a little slow in getting the list back to you... hang in there!

Those of you that can tell me about ANY of these programs compatibility with System 7 would be appreciated! I am going to be adding a System 7 compatability section to EACH description in future releases. If the application is KNOWN to execute properly under System 7, the System 7 anotation will be placed as the last line of the product description. More clarification on levels of System 7 compatibility in the future editions... but this is a start!

Some of the information in this list was gleaned from flyers supplied by the software vendors, or in some cases from reviews in amateur radio publications or the README files included with the archive. Some of the information has not been verified for a long time; please check with the vendors/authors for the latest product specs, pricing, etc.

NEW/CHANGES: A new group has been added... that of WEFAX. Although some of the software currently available supports this mode, RadFax is the first to be listed as the only function of receiving waether facsimille.

I've started adding more version numbers so that our users will know if they have the most current release. Thanks to those that have already sent them in... I'll accept all corrections!

This list contains info on updated for several applications: updated information on Kantronic's Host Master(thanks John-WD1V) and Lar's newest release of Morse Trainer 1.1.1. Ivo-ON1XK and Adam-PA2AGA both contnue to be busy with new releases of IM/Mac and NET/Mac repsectively. I know that Adam made changes to support the multiport serial boards... and now we can have up to 16 TNCs connected!

Thanks Adam, Ivo and Lars for some great products!

A reminder that The World Software Tool and Dye, is one of the newest site carrying the Mac Ham Radio Software. Scott-WY1Z is maintaining these file as the Librarian of the Boston Amateur Radio Club. Look in the following path at ftp.std.com: /pub/hamradio/mac.

Check at the bottom of this list for more information on ftp'able sites carrying Amateur Radio software.

The ARRL ListServer is also carrying the latest version of this list... in case you loose this one!

*** Collections ***
<MacNet v5.31>
Join MacNet and get included in the latest version of "Macnet Roster", a HyperCard 2.x stack that now has > 400 members and is the proverbial "Who's Who" of hams using Macs. You'll find "Macnet Roster" a great tool for finding out who, what and how other hams are using their Macs with their ham stations. It even includes this file!
Send $30.00($40.00 DX) check or money order to: WD1V, John Seney, 144 Pepperidge Drive Manchester, NH 03103 USA.
All disks shipped First Class Mail PPd. Get the COMPLETE Macnet Software Collection ppd. on 10 disks!
Based on your interests, you'll also receive public domain shareware received by our members.
System 7

<Project Mac>
Contest logging, antenna design, satellite tracking, clip art, etc. Microsoft BASIC required for many of the programs. Most of this software is now available in the MacNet collection. Send three formatted 800K Macintosh disks with stamped, self-addressed disk mailer to Stan Horzepa, WA1LOU, One Glen Ave., Wolcott, CT 06716-1442. Stan can be reached at horzepa@gdc.com
NOTE: Stan has indicated much of this software is "old" and may not work on some newer Macs. Also he notes that most of his collection is available in the MacNet collection above. He will send anyone what he has if you send him the disks and SAS mailer.

<Amateur Radio Software for Macintosh>
Extensive catalog including logging, Morse code, gray line, test preparation, satellite tracking, contesting, and packet radio programs.
ZCo Corporation, P.O. Box 3720, Nashua, NH 03061. NOTE: This company has been rumored to be out of business!

<Amateur Radio #1>
Contains satellite tracking, Morse code, attenuator design, and Ohm's law calculator programs. Kinetic Designs, P.O. Box 1646, Orange Park, FL 32067.

*** Test preparation ***
<Ham Test Stacks>
HyperCard stacks containing the entire question pool for each license class. Can be used for preparation or generating actual tests. The current releases are: Novice v4.1(new questions eff. 7/1/93), Technician v4.0(new questions effective 7/1/93), General v2.4, Advanced v2.4, Extra v2.4 If you wish to receive these PUBLIC DOMAIN stacks, please send a SASE (self addressed STAMPED envelope - 2 ounces postage = .52) and 800K diskette to the author: Diana L. Carlson, 3 Spruce Street, Hudson, NH 03051. Diana will no longer send out the stacks unless the envelope has sufficient postage for return mail (in general, that means .52-.98, depending on size of envelope) and for those who send a standard business envelope, she takes no responsibility for the condition of the diskette through US mail. Available via anonymous FTP from various sites, including uxc.cso.uiuc.edu (/pub/ham-radio). NOTE: The newest releases of Novice and Technician stacks are available at uxc.cso.uiuc.edu (5/6/93) Author is available via Internet: dls@genrad.com
System 7 savy with HyperCard 2.1

<MacHam>
Test generators and study aids for the Technician, General, Advanced, and Extra class written elements. Includes the complete question pool for each license. Hypercard based.
Coyne Co., P.O. Box 2000-200, Mission Viejo, CA 92692.
System 7 with HyperCard 2.1

*** Morse code practice ***
<N6MZV Morse Trainer>
Lets you practice any combination of letters, numbers, and/or punctuation characters. Can send user-created text files.
RT Martin, N6MZV, 10382 Orange Avenue, Cupertino, CA 95014. Also available via anonymous FTP from ftp.apple.com (/pub/ham-radio).
Shareware.

<Morse Code Tutor v1.6> - used to be called Morse Tutor
Sends random groups of letters, numbers, and/or punctuation characters. Available via anonymous FTP from ftp.apple.com (/pub/ham-radio). Or send formatted 800K Macintosh disk with stamped, self-addressed return disk mailer to Jack Brindle, WA4FIB, 726-175th Street SW, Bothell, WA 98012; Compuserve: 73365,606.

<MorseMania V1.0>
Designed for those already familiar with Morse code who want to improve their speed. Allows code practice at various speeds and audio pitches. Can generate random sequences or play the contents of user-created text files. Freeware. Available via anonymous FTP from whirlwind.stanford.edu (/pub). Contact Edward Plumer, KM6IQ, for more information; Internet: plumer@isl.stanford.edu.

<MacMorse>
Randomly sends chosen characters. Lets you create your own practice

files. David A. Kall, 700 Marine Parkway #314, New Port Richey, FL 34652.

<MacMorse v1.3>
MacMorse is designed to help you learn Morse code and improve your receiving speed. It has several ways that it can send letters and punctuation. Shareware. Doug Havenhill, Dynamics and Control, 7143 West Sunnyside Drive, Peoria, AZ 85345.

<MacSamuel>
Sends random words, random character groups, and user-created text files. Can also create simulated QSOs with randomly generated text and callsigns. Avant Systems, P.O. Box 5437, Pittsburgh, PA 15206.

<Zihua Morse>
Designed to teach Morse code to beginners and to improve the accuracy and speed of advanced users. Responses can be typed into the computer; the program will calculate accuracy and timing statistics for each session. Optional speech synthesizer reads the characters out loud for an accuracy check. Zihua, P.O. Box 51601, Pacific Grove, CA 93950.

<Sparks-II v2.0.5>
More Code training program. Available for anonymous ftp at rahul.net /pub/davidj/radio

<Morse Master v1.0>
The newest of the morse code training programs. MM calculates the real speed as follows: Real speed = Number of Words/end time - start time. And the lengh of word is generating randomly, so if you set even 5WPM, sometimes another value will appear. However you should believe the slidebutton's value. If you repeat many times, the average speed should be 5WPM (if not... anyway, believe the slidebutton's value). Archive is available mac.archive.umich.edu, path: mac/util/organization/morsemaster1.0.sit.hqx The author can be reached thru the following e-mail addresses: h79261a@kyu-cc.cc.kyushu-u.ac.jp. (Eiji AOL account is no longer valid - moved back to Japan after his studies.)

<Morse Trainer-US v1.1.1>
MorseTrainer is a powerful tool for learning and training Morse code. Features: Three different training modes: user text, random text, library text; Arbitrary signal pitch and timbre; Arbitrary speed and tempo; Multi-alphabet support; Random text generator; Text library editor; On-line alphabet; On-line manual; Help Balloons; And a lot more. New features in 1.1: Enhanced sound generator, volume control and risetime control. The pitch is set in steps of 10Hz instead of using MIDI frequencies; Speed and tempo limits increased to 80 words/minute as a result of the enhanced sound generator; User-selectable font in the Misc settings dialog. FREEWARE!
This version uses TrueType fonts instead on bitmaps fonts so that

the user can distinguish 0(zero) from O(character). Furthermore speed and tempo can be given in either characters/minute or words/minute. Archive is available mac.archive.umich.edu, path: mac/util/organization/ Author is available via internet: sund@tde.lth.se
System 7 savy

<CW Speed Builder v3.0>
This program is for improving Morse Code (CW) reception skill. The major difference between this and other Morse Code training programs is that this one will not continue sending until you provide the correct answer. Major changes which have been suggested and implemented since last version include: after three incorrect responses the program shows the correct character; the list of characters at the end which will show those you know and those you need more practice on; the frequency of the tone has been changed; volume of the tone has been reduced; the character " - " has been added (dah dit dit dit dah) Comments can be sent as follows: America Online:K7UPJ, Internet:k7upj@aol.com, Packet radio:K7UPJ@KA3T, Compu$erv:70521,2356, Mail:Box 84, Cascade, MD 21719

*** Packet and other digital modes ***
<NET/Mac 2.3.38>
Allows simultaneous TCP/IP, AX.25, and NET/ROM connections. Requires a TNC with KISS mode. Copyright, but free for noncommercial use. The latest releases have added the ability to cut and paste from the console window and support of multi-port serial boards like AE's QuadraLink. It is now possible to have up to 16 TNCs connected up to a Nubus Mac!
Adam van Gaalen, PA2AGA, (Internet: adam@IGG.TNO.NL) has been making the modifications to NET/Mac. This version (and others) is available via anonymous FTP from ucsd.edu (/hamradio/packet/tcpip/incoming), mac.archive.umich.edu and
System 7

++##NOTE##++
Adam recently sent oout a note to the distribution list about moving NET/Mac to Systerm 7 Pro. If you are contemplating this upgrade, Adam would like to know this... he would like to know about any particular features that System 7 Pro supports that you think should be added to NET/Mac. Please e-mail him at the address show above.

<Domain-to-Hosts Converter 1.0r3>
This application will create a hosts.net file from the domain.txt file that PC owners use with NOS. Created by Ken-NS1C is available on many TCP/IP packet switches in New England.program.
System 7

<IM/Mac 1.0b27y>
Mailer program for use with the SMTP protocol. Alternative to the

BM program that comes with NET/Mac. Written by Ivo van Ursel, ON1XK. Ivo is continuosly updating his mailer program. His newest release supports built-in BinHex support, selectable sound chimes for incoming mail, "quoting" of forwarded messages and lots more. If you are not using this program... why not? Check for the latest release in the directory before "blind" ftp'ing. This software supports System 7's Ballon Help and is System 7 savy! Available via anonymous FTP from ucsd.edu (/hamradio/packet/tcpip/incoming). Author is available via internet: on1xk@igg.tno.nl <<-- new address for Ivo
System 7 savy

<SoftKiss 1.8>
Control panel device that emulates a TNC running in KISS mode. For use with packet-radio modems such as the Baycom kit and PacketMac Modem. Version 1.8 July 9 1993 update since 1.6. KD6PAG found a bug in quoting recieved escape and end characters is sofktiss 1.6. The bug and the fix and patch are all correct, thanks for some great detective work. Lots of doc files and drawings included in this archive! Requires the Serial Tool from Apple's Communications Toolbox! Available on the HAMNET forum of Compuserve, America Online and via anonymous FTP from akutaktak.andrew.cmu.edu (/aw0g).
System 7

<PacketMac Modem>
PacketMac Modem kits can be obtained from: Sigma Design Associates, P.O. Box 49085, Colorado Springs, CO 80919, (719) 260-5513 (after 1/94). Dexter Francis can be reached at FRANCIS4@AppleLink.Apple.COM

<Savant 1.0.1>
A new packet terminal front-end by the author of Virtuoso. Savant has a split window interface, but it's also a multi-window, multi-connection interface and will work with almost any TNC, unlike MacRatt or HostMaster. Savant also is compatiple with SoftKISS and the PacketMac Modem.
A demo version of the product is available at cpre1.ee.iastate.edu (pub/ke0ph) or via US Mail, send a SAS disk mailer and disk to CM Technologies, Inc., RR#1, Box 83A, Kelley, IA 50134 (515) 597-2051.
System 7, 32-bit, '040 cache clean and it supports the required AppleEvents.

<MacRatt with FAX>
Terminal program for use with AEA's PK-232 multimode controller. Supports packet, CW, RTTY, AMTOR, and facsimile. Includes cable. Advanced Electronic Applications, P.O. Box C-2160, Lynnwood, WA 98036.

<Host Master 1.2>
The Kantronics Host Master software provides an easy to use, multifunctional terminal program for the TNC. Host Master Mac is a simultaneous multi-mode terminal program for the Mac written by Kevin Krueger, N0IOS and marketed by Kantronics. It is a commercial

product available from most of the ham radio stores and supports single and multiple packet connects, packet monitoring, and HF operation (with KAM) each on a separate window, all at the same time. This package retails for $69.95 in the US and is intuitive, friendly, and well supported by Kantronics. Current version as of 10/20/93 is 1.2. It is hoped that a future version will support FAX but currently Hostmaster supports PACKET, AMTOR, RTTY, PACTOR (KAM ver. 6.0), CW, and NAVTEX. Features: text and binary file transfer; packet conferencing; color or B&W windows; cut, copy, paste between windows; call exchange and data/time stamp; auto startup/shutdown commands; transmit buffers for each mode; simultaneous dual port, multiple connects; supports KPC-2, KPC-2400, KPC-4, KAM and Data Engine. Requires: Macintosh Plus w/ System 6.05 or better. Current Kantronics firmware.
System 7 compatible, with baloon help

<PacketTracker 1.05>
PacketTracker ver 1.05 is a program that monitors packet activity and keeps track of what is going on. It draws a graphical map showing who is talking to who and displays statistics of all current stations and keeps a running tally of activity. PacketTracker was written for both the casual packet user and the network manager or BBS operator. The casual packet user will be able to learn a great deal about what is happening in packet around him; which stations are generating the most data and what some of them are. he will be able to see graphically what stations he can hitdirectly and which ones he cannot. For the network manager and BBS operator, PacketTracker provides extensive insight to the operation of the local network and problems such as excessive retries on a path. It also allows for extensive logging of channel utilization and other pertinate information.
NOTE: This application requires the Apple's Serial Tool from the Communications Toolbox.
System 7

*** RTTY ***
<MacTTY>
Decodes Baudot or ASCII transmissions. Can also be used for packet radio and other digital modes (including landline data communications). Includes split screen, a 15,000-character type-ahead buffer, and canned messages. Summit Concepts, Suite 102-190, 1840 41st Ave., Capitola, CA 95010.

<MacMultiCom 1.0>
MFJ sells MacMultiCom 1.0 for their 1278 multimode controller. MacMultiCom supports all of the modes of the 1278: packet, rtty, ascii, pactor, amtor, gray scale faxes, and many different formats of color sstv. The program requires a minimum of a MacPlus and a hard disk. Requires a color Macintosh and System 7 for best results.
System 7

*** Logging *** <Ham Radio Station Logbook>
HyperCard stack that stores and displays radio contact information. Automatically stamps entries with time and date. Contacts can be sorted by frequency, call sign, or date of contact. Includes report formats, a "Q-code" reference list, and on-line help. SanSoft, 892 E. Quail Place, Highlands Ranch, CO 80126. (The same program appears to be available from Heizer Software, 1941 Oak Park Blvd., Suite 30, Pleasant Hill, CA 94523.)

<FDLog!>
Contact logging and duping program. Can transmit any of ten programmable CW messages. Generates real-time statistics on QSO rates. System One Control, 3900 85th Ave N, Suite 200, Brooklyn Park, MN 55443.

<MacContest 4.0>
The ultimate contest logging program for the Macintosh (System 7 proof). Covers CW/SSB/RTTY modes and all bands from 1.8 MHz to 5.7 GHz. Allows real-time or post contest logging for a wide variety of contests (30 contest include, new ones can be added). Checks for dupes, figures scores instantly. Offers various printouts (sorts per band, alpabetically, labels etc.) Interfaces to TNCs (KAM, PK-232) for CW, RTTY and packet modes. Built in terminal mode and packet DXcluster interface. Interface to Kenwood transceivers for automatic band/mode logging. MacinTalk voice output for real-time logging as well as to ease post-contest entry. Option to capture log in realtime to printer. Option to simultaneously create a save copy of the log to a different file/drive. Timetable showing actual grayline on a world map.
MacContest is free but must be personalized to each user (otherwis it's limited to 50 contacts). To get a copy send a 3.5" diskette and a SASE to Gerald Eberle, HB9CEY, PO Box 13, CH-4417 Ziefen, Switzerland.
Moritz (HB9BLZ) can act as a message forwarder for Gerald. Moritz' e-mail address is: gysslerm@saturn.kau.roche.com

<LOGic>
(Macintosh version scheduled.) Lets you define the rules determining dupes (such as once per band or once per contest). Displays heading, distance, and other information about the country being worked. Automatically enters contact time; if interfaced directly to a radio, also enters the frequency, band, and mode. Shows status toward earning amateur-radio awards. User-definable database fields. Exchanges data with other programs. Personal Database Applications, 2634 Meadow Bend Court, Duluth, GA 30136.

<HF Logger 1.2>
A real fine HyperCard logging program! (hey... thats all I got!)
N0QGQ

<Simple Log .2b>
This little utility is a handy way to create a logging file that you can later import into any data base for analysis, etc. It also

shows you that just about anyone can use Think C and create something on the Mac! Let me know if you'd like the source code. WD1V @ WA1WOK.NH.USA.NA Author is John Seney - WD1V, e-mail address is jseney@aol.com. For a copy of this program, mail a SASE disk mailer and 800K disk to: John D. Seney, WD1V, 144 Pepperidge Dr., Manchester, NH 03103
System 7

<Marathon>
Contesting/logging- Have seen references to (March 92 CQ magazine) and heard good things about MARATHON by N 0 IOS. I believe a demo was available for $8. Last address known is: Kevin Krueger, N0IOS, 1780 Ruth St., St.Paul, MN 551O9

*** Propagation, gray line, DX headings *** <DX Map v1.1>
Displays a map of the world with the terminator. Gives location, prefixes, zone numbers, distance, and heading for any country you select. Freeware. Requires HyperCard 2.0. Available via anonymous FTP from joker.optics.rochester.edu (in the /ham/dxmap directory). Or send a formatted 800K Macintosh disk with a stamped, self-addressed disk mailer to Len Saaf, NV2Z, 52 Raleigh Street, Rochester, NY 14620 (Internet: saaf@joker.optics.rochester.edu).

<SatTrak>
Primarily a satellite tracking program, but also calculates beam headings, Maidenhead grid locations, MUF plots, and band openings. Shareware. Available via anonymous FTP from sumex-aim.stanford.edu (/info-mac/app). Or send a formatted 800K or 14.MB Macintosh disk with stamped, self-addressed disk mailer to Mike Pflueger, WD8KPZ, 6207 W. Beverly Lane, Glendale, AZ 85306.

<Sun Clock>
Desk accessory. Displays a color map of the world, including the terminator. Indicates current time for any location. MLT Software, Inc., P.O. Box 368, Portland, OR 97207.

<DX Window>
Draws a great-circle world map centered on your QTH, with day/night terminator indicated. Displays over 400 DX locations with prefixes and beam headings. Engineering Systems, Inc., P.O. Box 939, Vienna, VA 22183.

<Skycom 1.1>
Enter solar flux and get propagation predictions to desired areas of the world. Engineering Systems, Inc., P.O. Box 939, Vienna, VA 22183.

<Skycom 1.5>
Provides sunlight status at both ends of a path; MUF, F0F2, and FOT frequencies; S/N ratio of the link; and other information. Engineering Systems, Inc., P.O. Box 939, Vienna, VA 22183.

<DX Helper v1.57B>
Displays beam heading, distance, gray line, and propagation information. Generates great-circle maps. Identifies prefixes, zones, and oblasts. Includes code practice. MacTrak Software, P.O. Box 1590, Port Orchard, WA 98336.

<Mac MiniMUF v5.1>
A greyline and propagation predictor based on the PC version of MiniMUF by K4CFV. It is available directly from him for the price of a formatted disk and SASE (disk mailer). His address in callbook or: Bob Stamper K4CFV, 12510 Shadowrun Blvd., Riverview, FL 33569

<Mac ShortWave v1.2>
A program called Mac Shortwave that figures MUF and LUF. BXA Research in Plano, Texas

*** WEFAX ***
<RadFax 0.9>
RadFax 0.9 is somewhat incomplete and may have bugs, it is capable of receive weather faximile messages via the sound input port of Macintosh computers. Basically you connect your Mac to a shortwave radio and tune in to weather fax station. You set the reception speed and desired resolution and start receiving.
I'm not sure if I'm going to add the features that I still feel are missing, but if I get enough shareware payments, I will do so. In any case, anyone who send me a shareware payment of $25 (cash prefered, but I guess there might be a way for me to cash checks too) will receive a disk with the full source code for the program. You will need at least Think C 5.0 and TCL to compile the program. Shareware payments should be sent to: Juri Munkki, Ehrensv 20B8, SF00150 Helsinki, Finland

<WeFaxWorks>
Weather facsimile terminal program for use with Kantronics TNCs. Kantronics rfconcepts, 1202 E. 23rd Street, Lawrence, KS 66046.

*** Satellite tracking ***
<SatTrack v1.02>
Tracks one satellite across a world map as it moves, displays the instantaneous position of several satellites, or generates tables of all satellites visible from a certain location at a given time. Also calculates beam headings, Maidenhead grid locations, and MUFs. Shareware. Available via anonymous FTP from sumex-aim.stanford.edu (/info-mac/app). Or send a formatted 800K Macintosh disk with stamped, self-addressed disk mailer to Mike Pflueger, WD8KPZ, 6207 W. Beverly Lane, Glendale, AZ 85306.

<MacSat v3.1>
Tracks up to 21 satellites simultaneously, either in simulation or real-time mode. Text screen displays ground-track coordinates, range, mean anomaly, visibility (azimuth and elevation) and Doppler shift frequency information for all satellites being tracked. Graphical screen portrays the satellite ground tracks superimposed

on a world map. Polar plot displays graphically the precise location of each visible satellite above the observer's horizon. Developed by the Geodetic Research Laboratory of the University of New Brunswick. Available from Richard B. Langley, R.R. 12, Fredericton, N.B. E3B 6H7, Canada (Internet: lang@unb.ca). A demo version of MacSat may be ftp'ed from directory PUB.CANSPACE on unbmvs1.csd.unb.ca.
System 7

<OrbiTrack> <OrbiTrackFPU v2.1.4>
Calculates look angles to selected satellites, plots current satellite positions on a world map, and displays the visible passage of a satellite against background stars (either within the program itself or via a data file that can be read into the Voyager astronomy program). Please note that one version requires an FPU to operate! BEK Developers, P.O. Box 47114, St. Petersburg, FL 33743. (Bill Bard, CompuServe: 75366,2557) (Note: This replaces BEK's previous MacSat program, which was not related to the program of the same name from UNB.)

<QuikMac>
Macintosh version of N4HY's QuikTrak program. Requires Microsoft BASIC. AMSAT, P.O. Box 27, Washington, DC 20044.

<Satellite Orbit Prediction Program>
Macintosh conversion of W3IWI program. Requires Microsoft BASIC. Send formatted 800K Macintosh disk with stamped, self-addressed disk mailer to Earl Skelton, N3ES, 6311 29th Place NW, Washington, DC 20015. Or send self-addressed stamped envelope for source listing.

<Satellite Pro>
Uses world maps and tables to indicate rising and setting schedules, current locations, mutual visibility opportunities, and footprints. Includes Mercator, polar, and great-circle displays. Optional antenna control. MacTrak Software, P.O. Box 1590, Port Orchard, WA 98366.

<Macintosh Spacecraft Personal Orbit Computations (MacSPOC)>
Software used aboard the Space Shuttle and in Mission Control to track the Shuttle. Models engine burns, orbit perturbations, and the Shuttle's orientation. Free online data uploads during Shuttle missions.
Commercial v1.5 available from Daniel R. Adamo, 4203 Moonlight Shadow Ct., Houston, TX 77059; telephone 713-480-9631; AppleLink: D3176; America Online: AdamoD. Test drive v1.1 available on AppleLink (path "K-12 Education: Education Resources: Science Resources: MacSPOC: Space Shuttle Orbit Software"). Author is on AOL and can be reached as adamod@aol.com via the internet.

*** Antenna design ***
<MacMiniNEC>
Chris Smolinski, N3JLY, 40 South Lake Way, Reisterstown, MD 21136.

*** Radio control ***
<ICOM Radio Control>
Provides a Macintosh interface for controlling ICOM transceivers that use the CI-V remote-control system. Lets you quickly change frequencies and modes. Also does logging and duping. Requires a CI-V to RS-422 converter (schematic included with program).
KE6FG Software, 9763 Pali Avenue, Tujunga, CA 91042.

<FreqValet>
Provides frequencies and DX program info for shortwave radio listeners. The program databases update automatically at 15, 30, or 60 minute intervals, thus providing a continuous display of broadcasts on-the-air at any given time in a spreadsheet like format. Features include sorting of data, scanning, and on-screen changing of databases. The program will convert Tom Sundstrom's dBase shorwave broadcast listing to FreqValet format and will do the same for Shorwave Navigator users. Separate cards are provided for DX Programs, Ship to Shore, and Utility broadcasts. Computer control modules are available at extra cost for the Drake R8, Kenwood R-5000, JRC NRD-525, and NRD-535 receivers.
DX Computing, 232 Squaw Creek Road, Willow Park, TX 76087.
Telephone (817) 441-9188 or (817) 441-5555 (fax). Author is available via internet: dxcomp@aol.com System 7 with HyperCard 2.1

*** Ham radio BBSs ***
<Digikron Systems BBS>
Various ham-related applications, including logging, propagation, Morse code, and packet. (408) 253-1309.

<N8EMR BBS>
Various ham-related files, including packet, DXing, and contesting software; AMSAT bulletins; and several ham newsletters. (614) 895-2553. Also available via FTP on AMPRnet at 44.70.0.1.

<WB3FFV BBS>
Various ham-related software, including packet, contesting, and Morse code applications. (410) 661-2475, 661-2598, and 661-2648.

<ChowdaNet BBS>
(more info at a later date)

*** Online Services carrying Ham Radio software ***
<America Online>
Supports Macintosh, PC's DOS & Windows versions, PS/1, Apple //s, Casio Zoomer. Ham Radio Club (keyword = ham radio) supports all computer types. Software for amateur radio, scanners, swl'ers and general electronics. For 10 FREE hours of trial time send your snail mail address to tstader@aol.com or call 1-800-827-6364 Ext. 6285. This site NOT ftb'able (yet). Internet e-mail.

<CompuServe>
Supports any communications software on most computers Ham Radio area (go hamnet) supports all types of communications formats. Call

1-800-848-8199 for information. This site NOT ftb'able.Internet
e-mail.

<Delphi>
(more info at a later date) Internet e-mail

<GEnie>
(more info at a later date) Internet e-mail

<Prodigy>
Has ham radio message areas, no downloadable software. Limited
internet e-mail.

Within one of the several help screens for arespack at the very last two lines
you will find the authors of DATA - one is Weo Morner, San Jose, 408 997 3195.
I dont remember if he is visible by doing a function key or shift function key
but certainly is if you read the help files outside of the program with say,
the type command.

Hi,

would appreciate some help. Trying to help a new ham in town. He just purchased an older PK232 and is interested in Packet. He has a Macintosh computer. Does anyone know of any software out there that is shareware/ freeware that is good?

thanks

Jeff, AC4HF

```
[much deleted]

>Having said that, those boards are in my opinion a bad choice. 902-928 is a
>shared band, and if you crank up the power even with narrow beam antenna, you
>are likely to interfer with something (like another wavelan, or possibly one
>of those new cordless phones). Besides, weak arguments about possibly
>interfering with someone else aside, those things are NOT amateur. Check
>out the ARRL handbook for a neat design for a 10GHz design that's MUCH
>cheaper, will not bother anyone, and is easy to build. It goes up to
>10MBps!

I saw the article in the handbook and it looks interesting, but I didn't find
a thing in the article that talked about computer to transceiver interfacing.
The schematic stoped at the +/- RX and +/- TX lines. Does anyone know what to
do with those lines to get them interfaced to a PC? Has anyone built this
project? Comments anyone?

Thanks
Jay

651. Comercial Data Over Radio

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-03-07 20:38:50 UTC
From: Rick_Whiting@ATK.COM
Message-ID: <9403072038.AA12459@ATK.COM>
Source record: 49996

Subject: Time:2:05 PM
OFFICE MEMO Comercial Data Over Radio Date:3/7/94
In reply to: need ssb packet radio info from
netcomsv!netcomsv!majiq!blair@decwrl.dec.com

The author wrote "I want to use marine ssb to transfer files between 2 vessels. Each vessel would be equiped with a PC, radio modem, software and SSB transceiver. I am looking for recommendations on how to get this to work. This would be for commercial use..."

The folks who manufacture ham TNC's/modems probably do more business with commercial customers than with hams. So, I'd recommend contacting them directly. Examples are: HAL Communications, P.O. Box 365, Urbana, IL 61801; Kantronics Corp., 1202 E. 23rd St., Lawrence, KS 66046; PacComm, 4413 N. Hesperides St., Tampa, FL 33614; to name a few. If you've got the big bucks there is always Harris, et al, too!

By the way, unless you have a special circumstance (read high S/N, low multipath channel) such as line of sight, I'd stay away from AX.25 on H F. It would be hard to devise a worse protocol for H.F., even if you tried. Look at PacTOR, CLOVER II, etc., in "ham" hardware.

73/Rick W0TN <rick_whiting@atk.com>

P.S. -- I'd prefer to answer by e-mail, but you didn't put name and info in your request for info.

See the information available by anon ftp on col.hp.com under
hamradio/packet/n6gn/uwvlink. The readme should help explain it.
The original article in Ham Radio magazine showed an IBM PCLAN adapter
card interface which was a sort of stop-gap solution. You might consider
the Gracilis card(s) for an interface. I suspect that the Ottowa PI
card might work as well, though not at full speed.

I thought I just posted this.

Hmmmmmm.

-pat N6QMY

N6QMY/BBS Internet Gateway Operating Instructions
April 11, 1993

LOCAL USERS:

Local users are those that log into the bbs via the bbs's telephone modem port (510-795-xxxx) or via one of the 4 tnc ports (145.09, 145.79, 223.62, or 441.50). Each local user has a bbs account that is used to customize how the bbs interacts with the user.

Local users can set their account up so that all incoming mail addressed to their call will be forwarded via a gateway to internet and on to other networks (mcimail, compuserve, etc). All the user needs to do is enter his email address and turn the feature on.

EMAIL bob@hal.com
EMAIL ON

When the EMAIL feature is turned on the packet message will be deleted at the time of forwarding through the gateway. So care should be taken that the paths are correct prior to turning the feature on, for instance enable it, send a test message, and disable it. After a successful transfer re-enable the feature. To disable the auto forwarding feature simply type:

EMAIL OFF

Messages can be sent by packet users to the internet users via the gateway. This applies to users at N6QMY as well as users at other bbs's. Begin by sending a message to IPGATE@N6QMY with the first line of the message being the letters "To:" followed by the internet address of the recipient.

KB6UCZ de N6QMY >
sp ipgate@n6qmy

```
Enter your subject:
Meeting?
Enter your message body:
To: bob@hal.com
Are you planning to attend the club meeting on Thursday? Give me
a call. 73, Theresa
^Z
```

NOTE: That the recipient cannot respond to the message unless they are a ham and registered with the gateway. He/she becomes registered by sending a message from his internet host to gateway-request@lbc.com.

REMOTE USERS:

Remote users are those that do not log into N6QMY directly but merely appear from the packet world to use it as home. If a packet user checks the "White Pages" for a remote user the entry comes back as @N6QMY. The packet user then address his message to YOURCALL@N6QMY and the bbs will do the translation and forwarding to internet.

It is not necessary for a person to know your actual internet address nor use the SP IPGATE method described above. From the packet network it appears that you are just another user at N6QMY.

WHITE PAGES:

The "White Pages" is a distributed database of all the bbs users. Most bbs users in the US are represented in the database as well as many from other countries. When a user chooses a home bbs, that bbs generates an update that is sent to the regional servers and then distributed to all the other bbs's. An entry consists of; call, home bbs, first name, zip, city and state. When a user wishes to send another packet user a message he/she consults the white pages (WP) for the home bbs.

REGISTERING:

Before a user, both local and remote, can send a message from internet into the bbs system he/she must register with the gateway. This is done by sending a message from the host that he/she intends to use to gateway-request@lbc.com with the following information:

CALL:
FIRST NAME:
CITY & ST:
ZIP:

HOME BBS:

When a request is received the "From" field is copied directly into a file with the requesters call. Whenever the gateway receives a message bound for packet it scans this file comparing on the "From" field. When a match is found the gateway uses the associated call from then on. If there is no match the mailer bounces the message with a one-liner

indicating the the user must register.

If you currently use another bbs as home this needs to be stated in the request. Otherwise you will be assigned N6QMY as your home. If you choose not to use N6QMY as your home you must make sure people know to send your message to YOURCALL@N6QMY to pass through the gate. Your WP entry will be wrong.

EXECUTING BBS COMMANDS REMOTELY:

Many of the commands available to local users is also available to remote users by sending a message to the bbs. Here is a subset of the commands currently available.

LIST listing messages
LOOKUP look up calls in the on-line callbook
WHO call dump a users account information
READ read messages and files
USERS n display the last n users to connect to the bbs
INFO display manual pages of various topics
CD change directories in the file system
LS/DIR display the contents of a directory
WP call look a user up in the "White Pages"
HELP get help on how to use a command

Not all commands available to local users can be accessed via the gate. All interactive commands are disabled as well as commands that modify the users account.

The command parser for the bbs is very powerful and the user can form very complex requests. For instance the following command is valid on the bbs:

LIST LAST 20 BULLETINS FROM N6QMY
LIST ALL BULLETINS ABOUT KENWOOD

The ABOUT keyword is used to search the subjects of messages for a given pattern, in this case KENWOOD. It can appear anywhere in the subject line.

This is an example of how complex all the commands can become. They can also be abbreviated down to the level understood my most other bbs programs. Any of the following will give the same results.

L< N6ZFJ
LIST FROM N6ZFJ
LIS < N6ZFJ
L FR N6ZFJ

In most cases a minimum number of unique characters is needed to distinguish a command.

You can get a list of commands and a translation chart from the W0RLI BBS command set to the N0ARY BBS command set by typing

the following commands:

INFO COMMANDS
INFO W0RLI

Other commands that you may wish to execute are:

INFO MANUAL
HELP HELP
HELP LIST

Now that you know what some of the commands are this is how you go
about executing them. You send a message to cmd@bbs.lbc.com
with your commands entered one per line or separated by semicolons.
For example if you want to know if three of your buddies are in
the white pages and if the bbs has any messages about the ICOM W2A.

Send to:
cmd@bbs.lbc.com

Subject: you can put anything here
wp n0ary n6zfj n6une
list all about w2a
.

The bbs will execute the commands and respond to you via return mail.

SENDING MAIL TO PACKET:

Once registered the user is free to begin using the gateway to send
messages from his host through the gateway into the packet world.
How much you have to specify of a users address depends on how much
the bbs already knows about the user.

If the bbs knows the home bbs of the user and his home bbs is know to
the N6QMY bbs, which many of them are, you simply need to supply
the call of the user.

n6oim@bbs.lbc.com

If the N6QMY bbs doesn't know of the user but does know where his
home bbs is, then you need to supply just the home bbs call in
addition to the users.

n6oim%n6iiu@bbs.lbc.com

Notice that the call and home bbs are separated by a percent sign '%'
rather then the '@' which is used in the packet domain. This is because
the '@' has a meaning in the internet address.

If the N6QMY bbs has no knowledge of either the user or his home bbs,
then you probably have the wrong home bbs or it is a new bbs. In which
case you will have to supply the full address so the bbs will know
how to route the message.

n6oim%n6iiu.#nocal.ca.usa.na@bbs.lbc.com

This level of addressing is hardly ever needed and normally means that
the home bbs is in error.

Bulletins can be sent in a similar fashion. The address is made up
of a keyword, which can be any six character word and a distribution.
Distributions are local to an area. For instance SBAY is valid in
northern CA, it probably has no meaning at all in Topeka, KS.

Valid distributions are:
ALLUS please avoid this one
ALLUSW all western US
ALLCA all California, any 2 letter state should work

So if you trying to find a cw filter for a Kenwood TS440.

Send to:
want%allca@bbs.lbc.com

Subject: Kenwood TS440, CW filter
If you have one of these you are willing to part with please
give me a call or leave message, thanks.
73, KB6UCZ@N6QMY.#NOCAL.CA.USA.NA
.

Be descriptive, brief, and always include your full return address in
the message. Also please try to limit your distributions to small
regions. Using the ALLUS distribution really slows down the flow of
messages.

INFO ON THE N6QMY BBS:

The bbs came into being in April of 1993 and was the second one anywhere
to run the N0ARY BBS code (the first being N0ARY himself). The bbs has
4 rf ports, 1 phone port, the internet port, and is working on a voice synthesizer port.
The latter would allow users to check for messages
via DTMF from their handhelds.

The bbs itself runs on a Sun workstation under Unix. The code was
written by Bob Arasmith (N0ARY) to focus on the user. Great care was
taken to make the bbs very forgiving to the novice user but very flexible
and powerful for the old-timer. The bbs can be configured to interact
with each user differently. Some examples are:

* List messages in either descending or ascending order.

* Specify a list of keywords that the user wishes not to see displayed
when a list is performed, similar to a kill file.

* .signature and .vacation files.

* Specify how many lines the users terminal is capable of displaying
before scrolling, the bbs will feed info this many lines and pause
allowing the user to catch up and continue or abort the operation.

Similar to more.

* Users can put commonly executed commands in keystroke macros that are accessible via a single keystroke.

A manual is currently available describing the commands and their permutations. This manual will be available later this year as a postscript file. Run the command INFO MANUAL to learn how to get one via the post office. It is not available in an ascii format.

If you have any questions about the internet gateway or the bbs in general please drop me a message.

Ok, I won't try and attach this opinion to anyone else ...
but will sure second it !

I agree with Doug - the bbs network was designed from the start to move
things from here to there. How the user looks at things is up to the
user. Many bbs codes support various ways to view what is available.
If your local bbs does not support what you want, you might consider
telling the author of that code what you would like.

You might also look into the various user interface programs, such as
TPK (and others). There may be one out there that does what you want.

gary@ke4zv.atl.ga.us (Gary Coffman) writes:
:
: The ARPA Internet (big 'I') is not to be used for commercial purposes.
: It's supposed to be used for "research" purposes only, though informational
: commercial material may be exchanged between manufacturers and interested
: researchers if the materials are related to research functions. However,
: the internet (small 'i') has no such restrictions. Large parts (most?) of
: it is via alternate carriers than the ARPA Internet. It can be considered
: the same as any other common carrier network for the purposes of regulation.
: (Note: since much of the internet (small 'i') is carried gratis by voluntary
: arrangements, sysop policies may discourage commercial messages, but this is
: different from the regulatory constraints faced by amateurs where actual
: criminal prosecutions can take place.) Usenet is an entirely different
: animal that travels over many different networks and dial up connections.
: It's a purely voluntary association of sysops and isn't beholden to either
: Internet or internet, nor bound by their rules of content.

this requirement, the so-called "Acceptable Use Policy" was removed in
early 1992 (approx. someone probably has the exact date.). This
removal is one of the promptings for the recent explosion of Internet
usage. BTW, the ARPA Internet has been gone for a number of years -
the AUP was transfered to the NFSNET which now makes up a minority
position of the Internet. The requirement was also only binding on
US users.

Since packet really took off a few years ago the UK rules changed such that messages from amateurs are not considered 'third party', so relaying of messages on behalf of other amateurs is OK. Club stations can also pass greetings messages from non-amateurs (useful for demo stations because you can give the mike to a non-licenced person to speak) to stations in certain countries.

>your IP to you, and ask him what's going on.

The problem is that in the UK the people who issue addresses generally wouldn't know what name service was if it came and hit them with a rolled up copy of RFC1035. Most of them don't have net access and I suspect some of them don't even know that the AMPRnet address block has anything to do with the Internet.. I tend to update my region (which I'm not coordinator of, I just do it anyway) every so often, but I don't think many of the other areas have been updated in years.. If I can get hold of a complete copy of the UK tables I might well upload the lot to ucsd at some point.

I also got this info... My concern is similar... It seems that it is a protocol that Kantronics developed. Are they putting this in the public domain so that others can develop to it, or is it a way to force people to buy Kantronics units.

As it turns out, I own a KAM and a AEA DSP-2232. So before I invest in another protocol, I want to see it from more than one vendor.

I just bought a bare bones Tandy 102 and wonder what extra
accessories I need to transmit and receive email and post
to a packet bbs?
I realize I need a license to transmit, but perhaps while
I am studying, I could listen or capture packets to understand
it better.
thanks for any info.
Also is anyone getting in trouble with the gov these days
for passing third party messages, as amateurs, in either
the US or Canada? I just read here that it is ok in the UK.
cheers
David Smith

Look at what the cops are driving. Ford Crown Victorias seem popular
with them, as do Chevy Caprices. Order your's with the same fleet codes
that they use and you'll have a car that works well with radios. (It'll
also have the heavy duty electrical system, cooling system, and suspension
of a cop car.) Get the same color scheme that they use for their unmarked
cars too, that way the antennas won't draw suspicion. (And you may avoid
some tickets.)

How about a Suburban with a Diesel engine? Only interfering electronics
you should have to worry about is the alternator. And it has tons of
space for antennas.

And no emissions controls. :-(Diesel smoke is a suspension of carbon particles impregnated with the byproducts of combustion, which is small enough to enter your lungs and lodge in the lung walls. Once lodged all those combustion byproducts leach out into your body. Diesel vehicles need dust traps at the very least.

I got a variety of responses for a car which would be good for 100 watts or so of HF and 50 or so of 2 meter and 440 radio. Criteria were lack of interference from car into receiver and from transmitter into auto electronics.

Diesels and the Taurus were among those favored. Anyone else have comments on these choices.

Tnx agn Bob

The third party rules are very strict in the UK, you have special Mailboxes and
special club callsigns to pass 3P traffic

A friend is into Low Freq communication. He bought a pickup truck with an
aluminum canopy. He can mount as many antennas as he wants on the canopy, but
still remove the whole thing for other uses. If he resells the only thing he
looses is the value of the canopy with all the holes (unless he buys another
truck and uses it on it).

Big problem is size. I use a toyota pickup and thanks to new technology I
don't loose too much space to gear. Not having a fancy centre console I don't
have to worry about what goes on the hump, and I only drive 2 across the front
anyway.

I have been acused of driving a fishboat with all the antennas hanging off it
though...>

Is this a Kantronics proprietory mode or are the specifications open so
people can implement their own nodes if they wish?

I am a bit worried about people locking themselves into closed systems,
supported by only one company. Ham Radio has been moving towards
consumer electronics for quite a while, but it's getting worse.

>on these choices.

People often say to buy a diesel because it won't generate any RFI. I wish they could have owned my diesel Nissan pickup. It had the most horrendous RFI I've ever experienced in a vehicle. There was a severe popping noise, similar to really severe ignition noise, any time the engine was running. I could disconnect the alternator belt and the battery (after starting the engine), and the noise was still there with no vehicle electrical equipment operating at all. It got into everything from the entertainment radio to HF, VHF, and UHF ham gear.

I tried every trick I know, (and I thought I knew them all), without any success. The dealer couldn't fix it. The zone office couldn't fix it. I even talked to factory engineers in Japan. Everyone was stumped. I finally sold the vehicle back to them and bought a Jeep pickup. Aside from some alternator whine, which I fixed with a choke, it's generated no RFI from it's 6 cylinder gasoline engine.

Ignition noise is often NOT the problem. It is very possible that the
engine used fuel injection (solenoids, square wave pulses), an electronic
fuel pump (my Pathfinder has a noise problem from the fuel pump), and
a computer system. So getting a diesel is not likely to be a big help. Now
in the old days of mechanical fuel pumps, carbs, etc. it might have been
fine...

Source record: 50030

Thank you, "John In Miami" for you comments.
However, if you are just going to voice your amusement at my reply,
then please don't fall victim to some of the same mistakes yourself...

1. Do research YOUR material before you post! This is about the best example of
bad spelling, incorrect grammar, and jumped-to conclusions that I have ever
seen... Did you actually read what I sent, or did you just laugh at it?

2. What have my relatives got to do with it? (I assume that you mean relatives,
john, even though you write "relitaves"!). I just gave some ideas to
help SOMEONE ELSE with their problem... (Did you really read it?)

3. As far as I am aware, my comments are still correct WHEN CONSIDERED FROM
MY GEOGRAPHIC position. I live in France, and the laws of that country
are in no way related to the laws of the USA or any state therein.
Don't forget, John, that everyone is entitled to their own point of view.

For example: In my messages (sent to a NON-RADIO AMATEUR!!) I said...

"First of all remember the licence conditions: An amateur licence is issued
to permit EXPERIMENTS IN RADIO ELECTRICITY, not to permit the establishment
of a communications network!!!!! (This is true in all countries! so... "

Well now I know that this statement is partly false. It is true in France,
but not necessarily in other countries. You learn something every day.
Why does this make you laugh???

4. I have never heard of "The Maritime Mobile Net" or "The Waterway Net",
so why do you imagine that if I stopped for a minute I would realise
that someone might use them? Or do you mean the "Marine VHF and HF voice"
services I mentioned in my message? (In which case did you really read it??)

So let's take a look at your message, and see if we can't find something to
laugh at there! (If my kids had presented this at school I would want to know
what their teachers were there for!!!)

|Date: Fri, 11 Mar 94 21:12:56 -0500

|To: ham-digital@ucsd.edu
|
|
|Well, let me say this. At the risk of offending anyone, And I don't mean to,
|capital A
|please folks, and this is directed with a smile at Tim research your material

|-- some bad grammar here!!!---| |punctuation
|before you post, I had the best laugh I've ever had read this newsgroup.
|----------------------------|----| grammar/tenses
|All, I can say is the following, Tim says that in part, amateur radio was
|----------------------------
|not created to build comunication networks, well, what do you call emerangancy,
-------------| get your quotations right! |spelling|
I did not say that: see above.
|The Maritime Mobile Net and The Waterway Net? Hence the word net,, "Internet"

Actually, "Net" as defined in the Oxford Dictionary means:
(apart from the traditional meaning of a meshwork of fabric),
"Something resembling a net, a reticulation or network."
"Net" in Internet referes to the interconnection of things, NOT to the
communication process. That is why it is called a "Communications" Network!
|
|I think if he stoped aminiute he would realize that his relitaves could use
| | | spelling and typing | spelling
|the Maritime Mobile Net, provided they could get thru all the fighting and
| I use 'through' because
I am British. You can use
what you like.
|crap going on down there, or they could use The Waterway Net.
| please, what is "all the fighting and crap" going on down where?
|Please forgive me, I don't mean to come off to stronge, I'm sorry but I just
| this word I don't know!
|had to get it off my chest.
|
|Regards, John In Miami

And best regards to you too, John. I'm glad my message makes you smile,
but I hope it is not with condescension.

I actually learned a lot from the answers to nick's original message, and the
comments and corrections to my reply. The only thing I learned from your
message, however, is that the world still contains people who find it amusing to
discover that others do not know what they know. But surely, that is the reason
for setting up information nets like this one?

So please John, let's stick to useful comments in future, eh?

Tim Walker (FA1JHD) France.

This was a *real* mechanical injection diesel engine. With *all* electrical systems disconnected, it still made the pseudo-ignition noise. The best guess we could come up with was that the plasma formed by combustion was somehow shock exciting something and causing it to radiate. We considered static discharges due to the rotating machinery, but we bonded *everything*, including finger stock on the crank and cam, and on the injection pump cam, and we put anti-static brushes on the clutch, all without making it go away. So I don't think that was it. It would sit there at idle in the shop and tear up every radio in the place with absolutely *no* electrical equipment operating on the vehicle. A real puzzle.

689. Q:Remote PC Control for Radio/TV receivers/scanners ?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-03-14 15:32:12 UTC
From: U211321@HNYKUN11.URC.KUN.NL
Message-ID: <16F79E88DS85.U211321@HNYKUN11.URC.KUN.NL>
Source record: 50034

Hello Netpeople,

I was wondering if by any chance there has evolved some sort of
Personal Computer remote control standard for radio and TV equipment,
like e.g. the GPIB interface for analogue measurement equipment 15 or
more years back.
I know nowadays you can buy TV-receiver cards for the PC which may
or may not be sufficiently shielded, what I do know is that with
soundcards the noise situation can't possibly be bettered without
making the product substantially more expensive and I guess this
holds for anything inside a PC processing HF and higher frequency
analogue signals.
Any radio & TV sets out there with GPIB or its successor ?

Thanks in advance, Bob.
u211321@hnykun11.uci.kun.NL
u211321@hnykun11.urc.kun.NL

For a wild shot, could there have been a Piezo-electric (sp?) effect taking
place with the ignitors or some such thing (i.e. the shock wave from
combustion causing a piezo-electric discharge)?

My '94 Chevy Lumina Euro seems OK for HF; I'd planted my Kenwood
TS-140 on the passenger seat the other day, and had NO problems.
75W out on 20M thru the cigarette lighter; OK, large capacitor and
ferrite torroid on power lines, left over from my '88 Grand Am whose
"Driver Information Center" didn't like the 20M band :-). Couldn't
even find the "birdies" from the Engine Control Module's uP!

The only discernable "noise" is a small bit of hash from the fuel pump,
and a lot of hash when raising/lowering the power windows. I suspect
a simple LCL Pi filter on the fuel pump harness (near the fuel pump)
would take out the noise, but so does the noise blanker on the radio.

BTW:
Not to make this a big sale pitch for GM, but we do a LOT of RFI
testing on our cars to make sure that they neither corrupt nor get
corrupted by ham rigs. Stop by the GM booth at the Dayton HamVention
and we can talk some more . . .

! WRONG !

We've been building diesel engine controllers for many many years.

In fact, we've got an engine controller for LP-fueled fork-lifts!

And we've got a controller for marine applications; one of them even
got submerged (with the boat) in salt-water for 10 weeks, and after
they dredged-out the boat (and cleaned-up the engine) the engine
started on the 1st-crank with THAT controller. But I digress.

There are several diesel models with computers controlling the
electronically controlled transmissions!

And what about the instrument cluster, CD player/Radio, etc.?

Hello folks,
Does anyone know where I can get information
on the L2 program used by Baycom. This is the TSR program that
is used to interface the Baycom terminal program with the hardware modem.
I am interested in cpu registers etc. that are used to communicate with
this L2 driver. Any info/sources would be appreciated.

My father uses a TS 50 and an IC901 in his taurus. only noise is slight alt whine on the 901. Only effect caused by xmitting is changing the speed of the key-in-ignition chime when xmitting on 440. He's happy with car.

Of course I hold onto my old 71 VW bus. Point ignition, generator, etc. all waay in the back, entire body grounded, lotsa room for rigs, etc. I'd hate to lose that car!

Changes: new mailing lists, .packet rmgroup, and .policy updates

(Note: The following is reprinted with the permission of the author.)

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info,
and rec.radio.swap newsgroups. It is intended to serve as a guide for the new
reader on what to find where. Questions and comments may be directed to the
author, Jay Maynard, K5ZC, by Internet electronic mail at
jmaynard@oac.hsc.uth.tmc.edu. This message was last changed on 18 September
1993 to add the mailing lists for the new rec.radio.amateur newsgroups, to
note the rmgroup of rec.radio.amateur.packet, and to officially retire some
(in)famous threads of discussion on rec.radio.amateur.policy.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list
for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions
were held on the mailing list, and sent to the mailboxes of those who had
signed up for it. When the Usenet software was created, and net news as we
now know it was developed, a newsgroup was created for hams: net.ham-radio.
The mailing list and the newsgroup were gatewayed together, eventually.

As the net grew, and as packet radio came into vogue, packet discussion began
to dominate other topics in the group and on the list. This resulted in the
logical solution: a group was created to hold the packet discussion, and
another corresponding mailing list was created as well: net.ham-radio.packet
and PACKET-RADIO, respectively.

These two groups served for several years, and went through Usenet's Great
Renaming essentially unchanged, moving from net.ham-radio[.packet] to
rec.ham-radio[.packet]. Readership and volume grew with the rest of the
network.

The INFO-HAMS mailing list was originally run from a US Army computer at
White Sands Missile Range, SIMTEL20. There were few problems with this
arrangement, but one was that the system was not supposed to be used for
commercial purposes. Since one of hams' favorite pastimes is swapping
gear, it was natural for hams to post messages about equipment for sale
to INFO-HAMS/rec.ham-radio. This ran afoul of SIMTEL20's no-commercial-use
restriction, and after some argument, a group was created specifically
```

for messages like that: rec.ham-radio.swap. This group wasn't gatewayed to a mailing list, thus avoiding problems.

While all this was happening, other folks wanted to discuss other aspects of the world of radio than the personal communications services. Those folks created the rec.radio.shortwave and rec.radio.noncomm newsgroups, and established the precedent of the rec.radio.* hierarchy, which in turn reflected Usenet's overall trend toward a hierarchical name structure.

The debate between proponents of a no-code ham radio license and its opponents grew fierce and voluminous in late 1989 and 1990. Eventually, both sides grew weary of the debate, and those who had not been involved even more so. A proposal for a newsgroup dedicated to licensing issues failed. A later proposal was made for a group that would cover the many recurring legal issues discussions. During discussion of the latter proposal, it became clear that it would be desirable to fit the ham radio groups under the rec.radio.* hierarchy. A full-blown reorganization was passed by Usenet voters in January 1991, leading to the overall structure we now use.

After the reorganization, more and more regular information postings began to appear, and were spread out across the various groups in rec.radio.*. Taking the successful example of the news.answers group, where informational postings from across the net are sent, the group rec.radio.info was created in December, 1992, with Mark Salyzyn, VE6MGS, initially serving as moderator.

In January, 1993, many users started complaining about the volume in rec.radio.amateur.misc. This led to a discussion about a second reorganization, which sparked the creation of a mailing list by Ian Kluft, KD6EUI. This list, which was eventually joined by many of the most prolific posters to the ham radio groups, came up with a proposal to add 11 groups to the rec.radio.amateur hierarchy in April 1993. The subsequent vote, held in May and early June, approved the creation of five groups: rec.radio.amateur.digital.misc (to replace .packet), .equipment, .homebrew, .antenna, and .space.

The Current Groups

I can hear you asking, "OK, so this is all neat history, but what does it have to do with me now?" The answer is that the history of each group has a direct bearing on what the group is used for, and what's considered appropriate where.

The easy one is rec.radio.amateur.misc. It is what rec.ham-radio was renamed to during the reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize

this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, should be removed by September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is now rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there.

The first reorganization added two groups to the list, one of which is rec.radio.amateur.policy. This group was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The other added group is rec.radio.cb. This is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently Mark Salyzyn, VE6MGS. The email address for submissions to the group is rec-radio-info@ve6mgs.ampr.ab.ca. Inquires and other administrivia should be directed to rec-radio-request@ve6mgs.ampr.ab.ca. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas,

commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

A Few Words on Crossposting
===========================

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

Satellite, shortwave and other electronic media news from Radio Sweden.

This week's bulletin was written by George Wood.

Packet Radio BID SCDX2196

All times UTC unless otherwise noted.

NORDIC MEDIA NEWS:

STOCKHOLM INTERNATIONAL--When the new Radio Sweden schedule goes into effect on March 27th, Radio Sweden is also officially launching Stockholm International on our FM transmitter on 89.6 MHz. The head of the Radio Sweden English Service, Sarah Roxstrom, discussed Stockholm International in today's edition of "MediaScan". For those of you who missed the program...

The channel currently carries a motley collection of programming from Radio Sweden in various languages (English, German, Russian, Swedish, Estonian, and Latvian), the immigrant programs department in many languages (Finnish, Greek, Serbo-Croatian, Macedonian, Slovenian, Assyrian, Spanish, Turkish, Polish, Albanian, and Arabic), and from domestic radio. Sarah Roxstrom:

"The idea now is to give this channel a new profile, more as a service to foreign visitors. This would mean extending the English and probably German programming. At the moment we broadcast an hour of the BBC World Service every morning between 6:00 and 7:00 AM local time. That's half an hour of "Newshour" at the moment, and half an hour of "Europe Today".

"From the 27th of March we're going to be broadcasting an hour and a half of "Morning Edition" from National Public Radio every day between 13:00 and 14:30 local time. That will be followed by the regular half hour from Radio Sweden in English. Because we're a local station, concentrating on Sweden and the other Nordic countries, we want to give our listeners the chance to hear world news from the BBC and from NPR."

When Sweden introduces Digital Audio Broadcasting, scheduled for 1995, Stockholm International will be one of the national channels in the DAB stream.

WORLD RADIO NETWORK--We're getting National Public Radio through the World Radio Network, which provides satellite channels in Europe and North America for international broadcasters in English, including Radio Sweden. WRN's Karl Miosga was also in today's program, where he announced that WRN is changing its audio subcarrier on Astra. The transponder will remain MTV's transponder 22, but on April 1 the audio will officially shift from 7.74 to 7.38 MHz. Tests will begin on the new audio frequency on around March 25th. The change is because many older satellite receivers don't reach 7.74 MHz audio.

Besides Stockholm International, WRN programming is also carried over Radio Finland's Capital FM in Helsinki on 103.7 MHz. In addition to Radio Finland, Capital FM rebroadcasts NPR and Radio Australia from WRN, as well as VOA, Deutsche Welle, and Radio France International. Cable systems in Europe relaying WRN include one in Croydon in the UK, and systems in Amsterdam and Dublin will be adding WRN at the end of March.

In North America a number of public radios stations will be carrying WRN programming.

Back here in Europe, WRN is working on adding a German service.

RADIO SWEDEN--When our new Radio Sweden schedule goes into effect on March 27th, we'll be available via WRN in Europe on MTV's Astra transponder 22, audio soon to be 7.38 MHz, at 20:00 hrs UTC, and to North America on the ASC-1 satellite, on SCOLA's transponder 23, audio 6.2 MHz, at 20:00 and 00:00 hrs UTC.

We'll also continue to be available in Europe on our own Astra channel, on the Sky Movies Gold transponder number 26, audio 7.74 MHz, at 16:15, 17:30, 21:30, and 22:30 hrs UTC and weekends at 20:30 hrs.

For those of you listening on shortwave, we'll be on the air to Europe at those times on 1179 and 6065 kHz, along with 9655 and 15390 kHz at 17:30, and 9655 kHz at 21:30 hrs. The 17:30 and 20:30 hrs broadcasts should also be audible in parts of Africa and the Middle East.

Our North American schedule will be at 12:30 and 13:30 hrs on 15240 and 17870 kHz and at 02:30 and 03:30 hrs on 6040 and 9850 kHz.

Latin American listeners can tune in at midnight 30 hours on 6065 and 9850 kHz.

We'll be broadcasting to Asia and the Pacific at 11:30 hrs on 13775, 15120, and 15240 kHz, at 23:30 hrs on 11910 kHz, and at 01:30 hrs on 9695 and 11695 kHz.

SIRIUS--Sweden's new Sirius satellite has begun testing from its new position alongside the Tele-X satellite at 5 degrees East. Sweden's TV 4, which is regularly on Tele-X, is also being relayed, as a test, on Sirius, on 11.932 GHz. And the Tele-X sound carriers, including Radio Sweden, are along as well. There have been tests in PAL on 12.015 GHz, and now there's a D2-MAC test pattern on 12.092 GHz.

Speculation continues about what stations may appear on Sirius. Can the Swedish Space Corporation lure Scansat to move its various TV3 and TV1000

channels from Astra? (Which would undoubtedly anger many Scandinavian Astra dish owners.) Bertil Sundberg speculates in "Paa TV" magazine that Scansat's FilmMax might consider moving from its location on distant Intelsat 601.

The feared interference between Sirius and Norway's Thor, located nearby at 1 degree West, and using the same frequencies, has not appeared (at least on my 1.2 meter dish, there might be more of a problem on smaller dishes).

FINLAND--All local radio licences in Finland are up for renewal this year. There are plans to build networks, and the national commercial TV network MTV (NOT the American music video network) has applied for a national radio licence. Currently Finland has no national commercial radio. (Kauto Huopio and FNB)

EUROPEAN MEDIA NEWS:

RADIO--There's a proposal for a new instore radio service for McDonalds. So far there's no indication where it might appear. But a radio station scheduled to appear on the CMT transponder on Intelsat 601 on 7.38 MHz has been delayed until May. It could be for McDonalds. (James Robinson)

There's a new radio station called "Arabic Radio" on MBC's transponder on Eutelsat II-F1, on 7.38 and 7.56 MHz. (James Robinson)

A radio station called "N-joy" is scheduled to begin on Premiere's Astra transponder 17 on 7.38 and 7.56 Mhz on April 4th at 16:44 hrs local time. (James Robinson)

CNN--CNN has appeared with a strong signal at 21.5 degrees East on 11.095 GHz. (Spyros Abatielos, Greece) Very curious. Eutelsat I-F5 is in this position, in an inclined orbit. Anyone else find this transmission?

ARIANE--The failure of the Ariane 63 launch, carrying the Turksat 1 and Eutelsat II-F5 satellites, was due to cooling problems and a faulty bearing. Alterations to equipment are now underway to prevent the re-occurence of such a problem, but this will mean that this year's launch schedule will not resume until the beginning of June.

This means that Astra 1D will not launch until December this year as a result of the Airane problems. The satellite was originally set for a September launch, but this will now not happen, putting a spanner in the works of a number of broadcasters who were counting on a successful launch on-time.

It is reported that all available transponders on Astra 1D have already been booked, although further details are yet to emerge. ("Skyguide")

QVC--The home shopping channel QVC, having lost its bid to buy Paramount in the US, is now said to be planning to expand into European markets. Clarification of the legal situation would, however, be required from the European Union. The current position is that teleshopping channels are prohibited unless they broadcast to one member state only. ("Skyguide")

QVC is currently part of the Sky Multi-Channels package. There are those who wonder why on earth such a channel bothers to scramble its signals?

NO NICK--Unconfirmed reports suggest that Sky and Viacom have dropped plans to launch Nick At Nite, advertised as part of the Sky Multi-channels package. Earlier reports suggested that the channel had been delayed due to problems with program rights and acquisitions.

In the event that the channel is dropped, at least for 1994, it is likely that the Travel Channel, already broadcasting on Intelsat 601, will be offered time on Astra and will join the multi-channels package to replace Nick at Nite.

In this event, the only apparent spare time is the 6:00 AM to 7:00 PM British time on JSTV's transponder 24, or the currently vacant (and Sky-owned) Transponder 47, which could be a more likely option. (Transponder 24 is now showing a new Astra promo tape in several languages during the spare hours.)

The Travel Channel currently broadcasts midday to midnight on Intelsat, so while there is enough time available on transponder 24 to carry the channel in its entirety, the time-shift could be a problem for the channel. ("Skyguide")

CHINESE CHANNEL--The Chinese Channel has announced that it will launch its European service on Astra on March 18, although it refuses to tell anyone which transponder it will launch on. ("Skyguide")

SKY SPORTS--Sky has temporarily shelved plans for Sky Sports Two (again) by transferring football matches which clash with the current West Indies cricket coverage to Sky One. The move is partially for technical reasons, namely the difficulty in getting viewers to re-tune their receivers, but primarily for marketing reasons. The soccer matches on Sky One are achieving very respectable ratings, and is
likely to bring an increased number of new subscribers to Sky Sports. ("Skyguide")

SKY FREEBIES--While the soccer is screened on Sky One, all the Sky Multi-channels broadcast in soft videocrypt mode, so a viewing card is not required. Again, this is partially for technical reasons (there are some Sky Sports subscribers who do not take multichannels), but also with the marketing intention of capturing the die-hard viewers who have not taken up a subscription to multichannels. ("Skyguide")

SKY MOVIES FREEBIES--Sky's promised preview weekend for non-movie subscribers, delayed from its original date in February, has now been announced for the weekend of April 9 and 10. The previous attempt had to be cancelled due to the objections of several major movie distributors. Presumably these difficulties have been ironed out, since Sky intends to "give away" a number of major movies in the April weekend, including Wayne's World, Cape Fear, Lethal Weapon 3, Alien 3, Edward Scissorhands and Star Trek 6. Sky Movies Gold will apparently not be included in the promotion. ("Skyguide")

INTELSAT--United Artists, provider of a number of television channels for the cable television industry in the UK, has announced that it will cease its conventional PAL broadcasts of Wire TV and The Parliamentary Channel in May, in favor of a digitally compressed service.

The channels will share just one transponder on Intelsat 601, thus saving UA some GBP 1.2 million a year in transponder and uplink rental. While cable operators will have no trouble obtaining suitable digital decompression equipment, (UA would be able to afford to give it away since it is saving so much money on transponder rental) home viewers are likely to be very much left out in the cold. ("Skyguide") Wire TV is already broadcasting coded, using the SAVE system, and shares its current transponder with the Learning Channel.

EURONEWS--Euronews, the troubled pan-European news channel, is in danger of being closed down because of spiralling costs and dwindling viewer levels. The channel faces impending competition from a news service planned by TF1. TF1 is to launch its news channel on June 24th. Jean-Pierre Elkabbach, chairman of France Television, has held initial talks with ARD in Germany. France Television said that ARD should invest in the channel and provide German-language news material. Discussions have also been held with RAI in Italy to operate on a similar basis. ("Satnews")

EUROPEAN CABLE TV ALLIANCE--A major pan-European cable television joint venture has been formed by Philips Media and United International Holdings Inc. An agreement in principle has been made to operate pan-European cable television services.

Philips currently has cable TV interests in Germany, the Netherlands, Belgium, France and Austria, and United has interests in Norway, Sweden, Ireland, Hungary and Malta. Cable services belonging to United in Israel will also be brought into the venture.

Out of the combined cable services, more than 1.5 million of the 2.5 million homes that are passed for service are connected and paying monthly subscriptions. The joint venture will be the largest privately-owned, multi-channel subscription TV company in Europe.

The alliance, subject to regulatory approval, will be concluded by the autumn. ("Satnews")

UKRAINE--A weekly 50 minute program from the Ukraine will be carried every Friday via the Ghorizont at 11 degrees West. This has been monitored between 22:50 and 23:42 hrs following OITV programming from Ostankino Channel 1 TV from Moscow on C-band 3675 MHz. (BBC Monitoring)

NORTH AMERICAN MEDIA NEWS:

INTERACTIVE TV--A well-publicised trial of futuristic cable television services has been delayed by Time Warner for six months as the technology is still not ready.

A spokesman for Time Warner Cable said that a trial of interactive television will be delayed until October at the earliest in Orlando. The planned Full Service Network trial is delayed due to refinements within the set-top control box and network computer software. But the company believes that it will still be providing service to more than 4,000 homes by the year-end, and 80 percent of its 7.8 million customers by 1998.

While Time Warner delays its service, AT&T, TCI and US West are extending an existing trial of Viewer-Controlled Cable TV until the end of June, adding a range of new features in a bid to gauge user feedback. The companies said that a number of operational changes will be made to the pay-per-view and video-on-demand cable television
service.

One of the new services will be a personal intermission service, whereby a customer can halt a video programme for 15 minutes at a time, rejoining the programme on another channel later. New programming will also be added to the service to assess whether customers are influenced by greater programming and technology changes. Trials of the network have been ongoing since 1992. ("Satnews")

LATIN AMERICAN MEDIA NEWS:

RADIO--The first Christian radio network via satellite in Latin America, ALAS, will soon begin technical tests, using an Intelsat 6 satellite (presumeably C-band on Intelsat 601 at 27.5 degrees West or Intelsat 605 at 24.5 degrees West). (HCJB via BBC Monitoring) Previous reports have indicated ALAS would use digital encryption, unfortunately denying HCJB reception to TVRO owners in the Americas.

ASIAN MEDIA NEWS:

INDIA--All India Radio is planning to introduce 20 radio channels, via 5 transponders on Insat 2B. Twelve of these channels will be earmarked for regional languages. (BBC Monitoring)

PUBLICATIONS:

The new edition of Radio Sweden's booklet "Communciations in Space: The DXers Guide to the Galaxy" is now available free of charge. Just write to Radio Sweden, S-105 10 Stockholm, Sweden. You can also send a fax. After the international access code from your country, the number is: 468-667-6283.

Sweden Calling DXers is the world's oldest radio program about international broadcasting. Radio Sweden has presented this round-up of radio news, features, and interviews on Tuesdays since 1948. It's currently broadcast on the first and third Tuesdays of the month.

Radio Sweden broadcasts in English (beginning Mar. 27):

Europe and Africa:

16:15 hrs on 1179 and 6065 kHz
17:30 hrs on 1179, 6065, 9655, and 15390 kHz
20:30 hrs on 1179, 6065 and 9655 kHz
21:30 hrs on 1179 and 6065 kHz, and
22:30 hrs on 1179 and 6065 kHz

Middle East and Africa:

17:30 hrs on 6065, 9655, and 15390 kHz
20:30 hrs on 6065 and 9655 kHz

Asia and the Pacific:

11:30 hrs on 13775, 15120, and 15240 kHz
23:30 hrs on 11910 kHz and
01:30 hrs on 9695 and 11695 kHz

North America:

12:30 and 13:30 hrs on 15240 and 17870 kHz
02:30 and 03:30 hrs on 6040 and 9850 kHz

South America:

00:30 hrs on 6065 and 9850 kHz

The broadcasts at 16:15, 17:30, 21:30, and 22:30 hrs (and weekends at 20:30) are also relayed to Europe by satellite:

Astra 1B (19.2 degrees East) transponder 26 (Sky Movies Gold/TV Asia/Adult Channel) at 11.597 GHz, audio subcarrier at 7.74 MHz,

Tele-X (5 degrees East) (TV4 transponder) at 12.207 GHz, audio subcarrier 7.38 MHz.

Radio Sweden is also relayed to Europe via the World Radio Network on MTV's transponder 22 on Astra, audio 7.38 MHz, daily at 20:00 hrs UTC.

Radio Sweden can also be heard on WRN's North American service on ASC-1, on SCOLA's transponder 23, audio 6.20 MHz, daily at 00:00 and 20:00 hrs.

Contributions can be sent to DX Editor George Wood by fax to +468-667-6283, from MCI Mail or CompuServe to the CompuServe mailbox 70247,3516, from Internet to 70247.3516@compuserve.com, or to SM0IIN at the packet radio BBS SM0ETV.

Reports can also be sent to:

Radio Sweden
S-105 10 Stockholm
Sweden

Contributions should be NEWS about electronic media--from shortwave to satellites--and not loggings of information already available from sources such as the "World Radio TV Handbook". Clubs and DX publications may reprint material as long as MediaScan/Sweden Calling DXers and the original contributor are acknowledged, with the exception of items from BBC Monitoring, which are copyright.

We welcome comments and suggestions about the electronic edition, Sweden Calling DXers, and our programs in general.

Thanks to this week's contributors Good Listening!

Looking for a FTP site with BITPK.EXE and TFPCX. This is supposedly a copy of TPK configured for the Baycom modem. TFPCX is the driver.

I have TPK up and running with a Baycom, but am still having mucho trouble with what is suspect is a problem with BPQZX25. Am also running with an old non-turbo IBM PC. This could be adding to my frustration.

The main reason for all this is I want YAPP protocol on the Baycom. I hear the Baycom group is working on this but I am anxious to download a few files and they are only accessible on YAPP.

704. Plans for DCD-3105 board

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-03-16 22:18:44 UTC
From: lawrence@combdyn.com
Message-ID: <1994Mar16.221844.14769@combdyn.com>
Source record: 49949
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.homebrew

I have some TNCs and some baycom boards on my multiport Packet BBS.

I was reading through the manual for one of the TNCs (DRSI DPK-2), and it talks about a DCD board option that basically goes inbetween the TCM3105 chip and its socket.

Having DCD has shown itself to be nice with the Software DCD that the KPC-3 TNC does. I have problems with Intermod and frontend overload problems, etc.

Without having to buy the board itself, are there plans on how to build this DCD unit?

And, would anybody know if it would work on Baycom modems built around the same chip.

Yes, but at a mere 18,000 pounds not many can afford such a car. Practically, I found the Cavallier reasonable RF quiet. Fiat Uno, too noisy. Diesels are definately better, they have a bigger battery too.

I would expect a useful increase on good links by using an MTU of 1024, unless you have fast switching radios, though haven't actually used X-1J for IP. We got >500bps FTP rates between NOS systems as opposed to ~300bps with MTU of 256. TxDelay was 100mS.

Regards, Dave

707. Propagation and Radio System Engineering.

Message-ID: <64827@uugate.wa7slg.ampr.org>
Source record: 49952

Hi, This message is in response to emillar@enlces.ufro.cl 's message requesting information on propagation. The source article on this subject is "Radio Propagation Fundamentals" by Kenneth Bullington. It was published in the Bell System Technical Journal (BSTJ), Volume XXXVI, #3, May 1957.

Of primary improtance to Packet Radio RF path engineering is the section on figuring Fresnel loss. This is the loss due to the path be partially occulted by the earth. Almost all terrestrial radio paths have this effect. Microwave paths, however can usually be engineered to reduce the effects, and thus greatly reduce the power requirements for a given path. Only when the beam width of the antenna, significantly attenuates in the direction of the interviening ground, between a transmitter and reciever, can the Fresnel Loss be ignored.

If u are also interested in general Radio System Engineering, my article in the 7th (1988) ARRL CNC, would also be of interest to you. That is, Radio System Engineering, as it applies to Packet Radio.

Source record: 49955

I currently have KA9Q NOS version 930507 running on my PC. My NOS is configured to get some newsgroups on an NNTP host server on our network. For example I get the newsgroup MTL.GENERAL (Montreal misc.)

My NOS get the news from the NNTP server with no problem. But when I try to telnet on my PC and try to go to the area with "a mtl.general" I receive the message "Mail file is busy, Abort or Retry ?".

If I copy the file general.txt that is in the directory \spool\mail\mtl to the directory \spool\mail and I try the command "a general" there is no problem.

Is there any way to read with "a mtl.general" without the need to copy the file in \spool\mail ?

Please respond to me to:

I'm a newly licensed ham and would like to try packet radio.

I think I've narrowed my choices to a Kantronics KPC3 or a MFJ-1974 (?)
Not too sure I have the right MFJ model number, it has some appeal for me
as it is HF capable (I know it ends in 4 and has the tuner LEDs).

Any opinions/thoughts/alternatives would be appreciated. I have an Icom
2-SAT handheld, Kenwood TS-120s HF rig, PC compatible and a Commodore 128
as possible equipment to hook to the TNC.

The local bbs up here is using node software (TheNet?) which doesn't allow someone to digipeat into it. To help out a friend, I told him I would change one of my digipeater to a node so that he can connect with it and instruct it to connect with the BBS.

Can someone tell me what the options are, and hopefully where the software can be dl'd? I will be using an MFJ 1270 (plain TAPR TNCII clone) and I have an eprom burner.

Thanks,

Larry W1HJF

Get the MFJ it's as simple as that. I had a KPC-3 and sold it because it is
impossible to modify because the hardware in the thing is compatible with
exactly nothing. I've since bought an MFJ-1270B (it's just like the 1278
only without any tuning lights on the front). I like it because it can be
modified for 9600 operation it will do HF packet, and I can put different
EPROMS in it (I currently runa KISS only EPROM). The KPC-3 is good for
beginners but I can garuntee (sp?) that you won't be happy with it for very
long. If you have any questions about either model feel free to E-mail
me at the Internet address listed below.

Does anyone have any experience running a Kantronics D4-10 in the
445 to 450 MHz range ? The stated spec for the radio is 428 to 436 MHz.

From: pfc@ripco.com
Message-ID: <CMy5u1.CpG@rci.ripco.com>
Source record: 49968

I'm looking for information on using gun diodes at 10Ghz and 24Ghz
using digital modulation as a multi channel repeater link. So far I have not
found any sources via gopher or ftp. Can anyone help me out on this?

I know that Alpha sells gunn diodes but I need more information on designing
the system.
---Thanks!

Ne> Does anyone have any experience running a Kantronics D4-10 in the
Ne> 445 to 450 MHz range ? The stated spec for the radio is 428 to 436
Ne> MHz.

Hi, Don. We bought a D4-10 from Universal Radio, and ordered it with
a second channel of 441.0. The factory tuned the radio up for that
channel with no hesitation or complaint. That's not as high as you
asked about, but above the "specs."

If you're doing it yourself, I think you can at least expect to
have to re-tune the radio.

721. KA9Q NOS on KPC-3

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-03-20 18:13:07 UTC
From: jremer@ub.d.umn.edu
Message-ID: <2mi3nj$cse@ub.d.umn.edu>
Source record: 49973

I am trying to run TCP-IP on my KPC-3 tnc. I am new to TCPIP, and not finding setting up NOS to be instant.

Where is the newest version of KA9Q NOS?
Is there a better software I should use? (being I am new, and the KPC3)
Is the autoexec.ppp file required?

I can receive packet mail via KB0JBZ @ WB0SVA.#NEMN.MN.USA.NA

Any help would be appreciated, as I am still learning.

I'd like to get my hands on an XPR library that does YAPP protocol.

Does such a beast exist?

If now, where can I find out how to create an XPR library and implement the YAPP protocol....perhaps I'll give it a try if I feel daring enough someday.

This would make a great addition to a Terminal package that supports XPR protocols...which talking over a TNC. Or in my case, when I link my landline BBS over to Packet. I'm mainly for making the file areas available over packet.

My intention here is to set up a internet<->packet gateway. The catch is I want it to be automatic. Once I made that decision I have to deal with Part 97's rules about third-party traffic. That's where the issue greys... What are my troubles? I know vulgarities are a problem, but anything else? If it's just vulgarities, I can just write something to screen those out. What other issues need to be dealt with. Or has that already been done?

Get the KPC-3. It will run on 20ma, can run off a 9V battery, has open squelch capability without needing mods, and has a mailbox that can be increased in size.

The PK88 is an old design. It retains much of the circuitry of the old TNC2 boards (original TNCs). It eats a LOT of power, then spills much of it in a 7805 regulator. The mailbox is small, etc.

The KPC-3 is a much better value for your money.

: Mike

18,000 ho ho, you've been reading the brochures ! Just decide on a
few creature comforts, a radio other than the one that comes standard
(unbelievably nasty) and you are talking a lot more dosh still. I managed
to resist the temptation of the central heating boiler and freezer, but
occasionally wonder about adding a winch. The headlamps are a bit
lacking (remember Spike Milligan's landladies' light-bulb jokes?) so a
pair of decent lamps is essential, and the lamp bracket needed is #200+
bull-bar shaped... these things are not much diffeerent to range-rover
prices when you get to decent levels of equipment...

With a heavy trailer behind and a pair of large horses, it's true
class shows.

The local RIS man has been given a Discovery with a pneumatic mast
through the roof. He's as happy as the proverbial dog with 2 tails.
they've bolted a 240v generator where the airconditioner pump would go.

Note for US readers, see lower photo on Feb QST cover to see one of
these vehicles out for a little fun....

Cheers
David

Just keep in mind that X.25 is absolutely NOT the same as or
compatible with AX.25 AFSK used by amateur radio operators.
You're from HP, so you already knew that, but many hams aren't
aware of the differences.

> Does anyone know the baud-rate and any other particulars.

Many available remote weather stations run at 2400 baud, using
direct FM modulation. Some networks can run 4800 or 9600 baud
over the air, depending on the frequencies and radios utilized.

>The KPC-3 is a much better value for your money.

Forget that. Neither the KPC-3 nor the PK88 has a hardware watchdog timer,
so either can melt down your radio. Neither accepts standard third party
TAPR firmware or hardware upgrades. Both use proprietary architectures and
firmware. Neither will easily allow you to use high speed modems in place
of the internal single chip telephone type modems they are designed to use,
which aren't as good as the TAPR style modems even at 1200 baud. And software
DCD is both slow and unreliable. Get a MFJ1270 or Paccomm Tiny 2 instead.
Both are true TAPR clones with compatible firmware and modem disconnects.
Both will accept the K3MC KISS ONLY ROM that's best for use with computers
rather than terminals. And both can be adapted to 9600 baud or 56 kb modems.
The MFJ has better shielding, but the Tiny 2 uses less power, your choice.
We've found that for unattended sites the MFJs are by far the most reliable.

>Is the autoexec.ppp file required?

My first piece of advice would be to use JNOS. the latest versions of JNOS
(and all your other favorite NOS packages) are available via anonymous ftp
from ucsd.edu. Ok next autoexec.ppp from the filename it looks like it's
probably been written for Point-to-point-protocal which isn't what you'll
be using on the radio. If you want send me and E-mail message and I can send
you a copy of my autoexec.nos file and you can edit it for your own use. (change
callsigns and such).

Also I recommend you order a book call NOSview from the ARRL. It's written by Ian Wade and
explains NOS very well. It's geared toward the beginner.

If you have any questions feel free to E-mail me at the address listed below.

I believe that there are KISS roms available for the TNC-1, of which
this is one. That would enable you to use it with G8BPQ, NOS, and other
advanced packet software packages.

It won't run at 9600 bps, unfortunately.

UPS last nite dropped off my Kantronics KPC-3 (YAY!), so I'm soon to be packet-positive. Got one question:

Since my HT (htx202) is my only rig at the moment, are there any special considerations while wiring up the mic plug for packet?

The KPC-3 manual does not specifically mention this radio in the wiring section, but since Icom speaker-mics (I think, working from memory) work with the 202, that's a tiny hint to follow the Icom wiring diagram.

Any tips/suggestions/etc. will be appreciated.

: Hi All:
: Can someone please answer some questions for me?
: Can one receive Usenet News and post News replies via Packet Radio.
: I understand that it is possible to send and receive internet email
: via packet radio but what about news.

email is ok, but Usenet News is frowned upon. It generates lots of traffic,
and the content is not always appropriate for radio.

: Can you obtain an internet ip address for a packet radio setup
: for personal use? Can you telnet into other systems with packet just like
: a regular internet account.

You get a 44.xxx.xxx.xxx net (AMPRnet) IP address. You can telnet anywhere
on the internet, but you must be aware that you are on a very insecure
link with radio, many people are watching what you do, and just might copy
down your password. It's also slow, too.

: If I can get news and mail I would be interested in purchasing the
: equipment and applying for a license. What type of license would I need.
: Novice or Tech.

I'm not sure. Here in Canada, you just need what they call a basic license.

: I would appreciate any answers that anyone can give.
: Thanks for your time.
: Andre Bell < abell@tyrell.net > internet.

I really encourage you to get your license. It's one of the best hobbies
going, Amatuer Radio, that is.

Yep, the Icom info is what to use. One caution: look over the
plug very carefully under a magnifying glass for loose connections.
They are very small and fragile - mine developed a loose connection
where the solder lug is rivited to the center conductor and drove
me nuts trying to find the problem, since it was VERY intermittent.
It wouldn't work when plugged into the radio, but when removed for
continuity testing, of course it was ok. Just make sure it's solid.

748. [REPOST] NTS Traffic on Packet

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-03-22 21:27:05 UTC
From: yarbrda@moose.gdss.grumman.com
Message-ID: <YARBRDA.94Mar22162706@moose.gdss.grumman.com>
Source record: 49842

[This is a repost of an article I sent out on March 15....since I
can't find it anywhere other than at my news feeder's site, I suppose
it got dropped on the floor...somebody correct me if I'm wrong, please]

I'm curious about how NTS traffic travels on packet. If someone has a
reference on the technical aspects of how it works, I'd be very
interested (I've got the "how-to" kinds of information, like how you
format and send an NTS message via packet; I'm interested in the
details of how it happens once I enter "/ex").

For some more specific questions:

1) if I put a traffic message on a PBBS, how long is that message
likely to remain there for a human to pick up, before the PBBS
automatically tries to start forwarding it to a another system?

2) Like 1, but applied to intermediate forwarding systems along the
way to the final destination PBBS.

3) What determines if a particular PBBS will receive NTS traffic
destined for a particular area around that PBBS.

Thanks for the enlightenment.

Danny

749. [REPOST] The # in PBBS addresses....

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-03-22 21:28:33 UTC
From: yarbrda@moose.gdss.grumman.com
Message-ID: <YARBRDA.94Mar22162833@moose.gdss.grumman.com>
Source record: 49843

[This one, also posted on Mar 15, also seems to have been dropped by
my feeder]

What's the significance of the # in certain PBBS addresses? I've seen
them used with some places and not in others. For example, my own is

ke4dxa @n4lxi.#nova.va.us.noam.

(if memory serves :-). Yet I've seen others that would leave it off.
I've also seen various uses of us vs. usa, and na vs. noam. Which one
is correct (or are they all?).

Thanks,

Danny

:
In the KPC-3 'Getting Started' book and in the 'Reference Manual', the
pictures provided for wiring examples show the microphone going to the
larger of the two 'mini' plugs, and the speaker going to the smaller.
This is reversed from how it really is. I've never seen anyone
complain about this, however, I'm sure I'm correct about this.
Any comments?

I haven't been following the development of NOS for quite some time now, so maybe someone here can give me a hand.

I currently use a PC as a router between an AX25 LAN and an ETHERNET LAN. I want to expand the number of channels to include not only the AX.25 LAN, but also a bunch of dialup SLIP users. I have at my disposal a MicroVAX II with about 10 serial ports. Is there currently available a version of NOS that will run on the MicroVAX under ULTRIX that will utilize both the serial ports and the ETHERNET and allow routing between them??

Source record: 49853

Much like a regular packet message, the decision to route a
message is done via a hierarchial address assigned to the zip code
or part thereof. From there, things get complicated.
If I have a message to go to Europe, my best route is to
send it to KP4GE in Puerto Rico. We have an excellent path and
Ramon connects often to get mail into Europe. IF 20 meters is
open, it goes as soon as I have time to punch the buttons. (HF
can also be automated however there is a strong push to do away
with automated HF. Some hope that it will be forced into small
band segments and thereby die by strangulation. The FCC has been
approached with this form of rulemaking. The result is that I
trade automation for the better throughput of pactor. The effect
is that there will be digital signals in a VERY wide area of the
band as pactor requires one frequency for two stations rather than
the ten or fifteen that used to share our HF packet net on one
frequency). Once KP4GE gets it, he will forward it into Europe.
Obvious is the fact that we need (1) propagation and (2)
time to punch buttons and attend the HF station.
Traffic on VHF will move quickly as virtually all of my area
BBS stations are in a constant forwarding loop. However, the
steps are smaller and it takes longer. Everything is automated
and no propagational effects are there to hold things up. Messages
between Cleveland and Columbus should not take more than an hour
or two.
So what holds things up? Propagation is not really a factor.
I can get to KP4GE almost at will now that we have pactor. He can
also get to Europe without too much fuss. HF routing is now
dependent on the sysop's schedule. VHF requires that the route
is there. A power failure or disk crash can hold things up
quite a bit. So can Sundays (KP4GE is a preacher). If I am
out of town camping, it has to wait a few more hours until KP4GE
checks. Visa versa if he is gone. If there is a catastrophic
failure, the traffic would be routed two BBSs west, to the next
HF forwarder.
How long does it take? There are too many variables to
consider. Don't like the varialbes? Keep it on voice as if the
same variables aren't there, too.
73,
Steve

>Its priced roughly in the same ballpark as the KPC-3.
>Dave, KD6RRS

This is a plug. I just bought an AEA PK-96. This is a new TNC.
It's a combination AFSK (1200 baud) and FSK (9600 baud G3RUH) tnc.
In theory, you can have it all in one package. No ripping out
the disconnect header every time you switch. I overpaid at $190
but am not complaining. It draws 400ma at 13.6v (3.5w) so it's
not exactly suitable for battery operation. Too soon to tell if
it's any good. Anyway, it is possible to buy a TNC that will do
both 1200 and 9600. IMHO, tcp/ip should be run at 9600 and not
1200. It's just too slow.

Source record: 49861

Subject: Time:1:52 PM
OFFICE MEMO HF Digital Throughput Date:3/24/94
Based on published test data, here is my reading on the typical throughput (characters per second) to be expected from several HF digital modes:

RTTY 6
AMTOR (ARQ) 5
Packet AX.25 4
PacTOR 10
G-TOR 25
CLOVER II 50

Note that Huffman data compression is available in the PacTOR and G-TOR protocols to increase throughput for certain data. Note also, that these throughputs are not normalized to occupied bandwidth. If one looks at characters per second per hertz there are even more dramatic differences.

: features a single-chip FSK modem 4800/9600/19200. It also says
: it is complete compatible with K9NG and G3RUH modems.

: Is it really all features of G3RUH (scrambler/descramler, FIR filtr,
: DPLL clock recovery) in single-chip ? What is name of chip ? What is
: price ? Or maybe it is a some DSP chip with software support for all
: g3ruh features..? Can you tell me some more about this design in
: DPK-9600 ?"

I evaluated one for the VITA organization with UO-22 and KO-23. The performance on rx was VERY poor. The recieved data rate was about 20% of my DSP-12. I talked to DRSI, and they acknowledged they had a problem decoding packets from the satellites. My findings were duplicated by Andy McAllister of AMSAT.

There is a single chip which seems to handle most of the modem functions, but it's propriotary to DRSI I believe.

I can't speak for the performance on terrestrial packet, DRSI said it worked well there. It's unfortunate that it works so poorly with the satellites, it's packaged in a tiny case, and draws very little power. Aside from the fact it doesin't work, I liked it :).

Well, it is possible to access a Waffle BBS via packet. The problem isn't technical so much as legal. You can't have business traffic on amateur frequencies, so you or someone else would have to monitor stuff pretty closely.

Source record: 49871

> > I have read in the newsgroup rec.radio...
> > in Amerika you have a mailgateway between Packet-Radio
> > and Internet.

How to Use the WB7TPY
Packet <-> Internet Gateway

First, some brief operational notes:

(1) Messages must not contain any foul language, or commercial purpose.
(2) Messages can only be sent to countries that the United States has
a third-party agreement. All others will be destroyed.
(3) Messages from the internet should be less then 5K in length.
No files should be sent.
(4) If you have questions, please do not hesitate to contact me either on
packet radio: WB7TPY@WB7TPY.AZ.USA.NA -or-
Internet : david@stat.com

(5) Have fun. Use the gateway as much as you like. That is what it is
there for.

From Internet to Packet

Send mail to the internet address of:

gate@wb7tpy.ampr.org

The first line of text must contain a full packet address, preceded with the
word "Packet:"

For example, mail to my packet address, would have the first line of text;

Packet: wb7tpy@wb7tpy.az.usa.na

** NOTE: this line MUST be left justified.

From Packet to Internet

Send as private mail (never a bulletin) to the packet address of:

gate@wb7tpy.az.usa.na

The first line of text must contain a full domained internet address,
proceeded with the word "Internet:"

For example, mail to my internet address, would have the first line of text;

Internet: david@stat.com

Editor, HICNet Medical Newsletter
Internet: david@stat.com FAX: +1 (602) 451-1165
Bitnet : ATW1H@ASUACAD

778. Re: [REPOST] NTS Traffic on Packet

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-03-28 15:53:10 UTC
From: n1ist@netcom.com
Message-ID: <n1istCnDtGM.4r6@netcom.com>
Source record: 49872

Maybe other areas should do what we do here in Eastern Massachusetts.
Here, we have assigned liasons between our local NTS BBS (K1UGM.MA)
and both nightly NTS nets (EM2MN at 20:00 and HHTN at 22:30). At most, a
message will sit around for one day waiting to be picked up (but many
traffic handlers will grab any traffic they can handle whenever they check in)

This definitely helps keep the traffic flowing.

-> A whole bunch of old 9600bps data radios have become
-> available.....they do something like DGMSK or letters to that
-> effect....and immediately its said that's illegal. because its not
-> AFSK...and the units don't do AX.25.

Rubbish. Read RIC 24 and RIC 25. You can't use a secret code - any coding done to improve information handling is OK, if you're using something unusual you should be prepared to explain how it works to the local DOC. You must faithfully observe the bandwidth limitiations in the table. You must of course not use frequencies below 50 MHZ if you don't know how to send Morse. Aside from that, there is no restriction on what you can use (in Canada) for amateur radio data. The US rules are written more for the benefit of lawyers and hams but their problems need not concern you; and from what I've read the only restrictions they have is that 3rd party traffic handled by an unattended station must use AX.25 - they also have some baud rate restrictions. Local rules only, don't apply to you, have fun. Get a G3RUH or K9NG modem from TAPR, couple of old radios, and leave 1200 in the dust.

|> code table in a router shouldn't tax modern machines.)

The full address for any domain within the BBS network includes
a (normally implied) ".ampr.org" at the end. Within the BBS
network, we drop this. It is the responsibility of the gateway
software to handle the required domain name translations.

The actual problem we wish to solve by using "NOAM" instead of
"NA" has nothing at all to do with message routing. It is simply
a matter of user education. Users *of the interenet* have been
sending messages *in that network* to "xx.usa.na". Those messages
quite properly get to Namibia. This is not quite what the user
intended when they made the addressing blunder.

783. HF Throughput Revisited

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-03-28 20:05:33 UTC
From: Rick_Whiting@ATK.COM
Message-ID: <9403282005.AA15498@ATK.COM>
Source record: 49878

Subject: Time:2:03 PM
OFFICE MEMO HF Throughput Revisited Date:3/28/94
Mike Van Der Westhuizen, ZS6UP, reported a mean throughput for CLOVER II of 15.5 CPS and PacTOR of 9.7 CPS in on-the-air tests on 40 M ("A practical Comparison Between Clover and Pactor Data Transfer Rates," CQ, Vol. 50, No. 2, Feb. 1994, pp. 40, 42. [I'm surprised CLOVER did not do better.] Based on this and other published data, the throughput (CPS) for various protocols on HF would appear to line up as follows: AX.25 Packet 4, AMTOR ARQ 5, RTTY 6, PacTOR 9-10, CLOVER 16, and G-TOR 24.

By the way, I don't think the Kantronics KAM used in Westhuizen's tests implemented hardware ADC Memory ARQ. Furthermore, the various throughput data cited above were not taken by the same experimenters under similar conditions, etc.

Of course, there are many features that differentiate the different protocols beside typical throughput, not the least of which is throughput normalized to bandwidth, i.e., CPS per hertz. And the maximum throughput may be much higher than the throughput measured under typical conditions (if there is such a thing as "typical" conditions on HF!).

Comments anyone? Reply via e-mail and I'll summarize.

73/Rick W0TN <rick_whiting@atk.com>

From: greg@netcom.com
Message-ID: <gregCnE9Hv.Aqx@netcom.com>
Source record: 49880

I decided to call AEA on my question of whether the wildly different tone amplitudes is normal (really hoping that they'd point me at a pot to tweak).

The gentleman didn't hesitate a second when I told him of the difference, and how large it was. "Yup," says he, "that's expected."

Nope, the mark/space amplitude ratio is fixed. No hope of a simple tweak to fix it.

The difference is caused, as speculated, by the SSB rig's tendency to emphasize highs (hence the famous Drake audio 'punch') for intelligibility. I guess it isn't good, but I'm at least putting out the same wrong signal that lots of other people are :-(

I am at once relieved and disappointed. But I guess that the RTTY purists will chuckle and ask me what I expected when asking a sports car to do the job of a pickup truck.

Someday... a nice solid exciter with true hetrodyne FSK capability into an 813 or two for digital modes, modulated by another 813 or two for Ancient Modulation (*both* sidebands please)...

Greg

It's about time this point was brought out and I want to thank Hank
for doing it. We have the same problem around here. Some people think
that because I run a BBS, I want to deliver NTS traffic. Not true.
Like Hank said, I provide the pipe for the flow (at considerable
expense and manpower). I don't provide the material that flows through
it, nor the mechanism to supply what flows. That's up to the users.
I'll help where and when I can, but my interest is in the pipe.

Thanks, Hank, for stating it the way you did. I really think this
should be passed around on packet for the non-netters to contemplate.

I am trying to get this set up in West Mass as well. One problem I do see is
that the BBS community sets up new BBS's, turns on NTS handling abilities,
then expects that the NTS folks will somehow find those new BBS's and check
for messages on them. The BBS constructing folks really need to talk on
occasion with others to let others know what's up.

The problems with NTS use of BBS's are not the fault of the BBS folks or the
NTS folks exclusively. The groups need to talk and make sure they are in
sync. The alternative is visible as "status-qou" in most parts of the
country, where each group complains about the other.

789. HELP: Anyone know what a XR2206 chip is?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-03-28 23:46:04 UTC
From: zawada@softage.demon.co.uk
Message-ID: <CnEFCs.Hso@demon.co.uk>
Source record: 49884
Cross-posted to: sci.electronics,rec.radio.amateur.digital.misc,rec.radio.amateur.misc,uk.misc

Help, has anyone out there heard of a chip XR2206?

It's used in a converter to send SSTVFAX in a shareware program called SSTVFAX2. From what I can make out, it seems to be some kind of modem chip, but I can't find it in any of the catalogues I have. Can anyone help me with any of the following information?

1. Has it got an equivalent chip I can use instead?

2. About how much is it?

3. Give me an address anywhere (any country), I can order it from.

Thanks in advance.

790. NTS Only BBS? (was Re: [REPOST] NTS Traffic on Packet)

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-03-29 01:30:17 UTC
From: gganderson@augustana.edu
Message-ID: <gganderson.321.0@augustana.edu>
Source record: 49885

A dumb set of questions regarding BBS and NTS, with a follow:

(1) Would there be enough NTS traffic to warrant a set of NTS only
(or at least NTS priority) BBS systems across the country to forward
NTS-type traffic?

(2) I how much time, effort, and cost is involved in running a BBS?

I ask not to point any fingers, but because I can't fathom what
the costs would be. I can think of there being the expense for
a good antenna, a reasonable 2m rig (50 watts?), a reasonably
fast computer (486 of some flavor) with a decent size hard disk,
that this power-hungry computer (400 VA watts?) would be running
24 hours a day, your time and effort in seeing that the computer
and radio keep running. I suspect MUCH IS already being given
by BBS operators as a service, but I'm just curious of the
accounting. Maybe a few statements by BBS operators will
enlighten more than a few of us of the services we use and
keep asking for without thinking about hidden costs, or at
least costs we've individually externalized. Amateur radio is
very much a hobby of willful giving and sharing, and we shouldn't
come to expect when expectations shouldn't be there.

At the same time, though, I would hope some compromise/working
solution can be found between NTS and BBS operations, which
is what prompted me to post.

Enough said. Off the orange crate.

I am new to the ham world but would like to know more. My goal is to bring Solar Energy information to the Third world people who have ham, and I think the best way is by packet. I have build t board, but haven't tested it, and assume it won't work. What I would like is a simple resource, for myself and people I will non profit, non business be communicating with. Are there any books that can explain Terminal Node conection, satalite hook up? Is there an Oscar that I can use, also is there a VITASAT that anyone knows about hooking into. I have 2 meter rubber duckin and all the computers I need. We will be having a T1 internet connection that could also be useful.

Sorry about all the questions. Thanks in advance.

This device is a Monolithic Function Generator made by EXAR.
Don't know where do get them anymore. I think EXAR died or
or was purchased by someone. Expect the part number of have the
same numbers but change its prefix.

It should be inexpensive ($10 or less).

I do know of a supplier that stocks old - hard to find stuff.

Hi,

We just got 25 (minimum order) of these at my work from either Exar
or from their distributor (I don't know which off-hand.) If you need more
info, email me; I have the data book on my desk.

Message-ID: <1994Mar29.152555.1@ugun2a>
Source record: 49790

Would anybody know how to manage forward between a tcp/ip STATION
and a f6fbb BBS without being declared as a BBS (eg, when you send out
to the f6fbb BBS the command sp xxxxx < hb9vbc @ hb9vbc, it immediately
advises the sysop and tells you that they don't forward to hb9vbc bbs!)
Where does this have to be fixed ?
Secondly, we are trying to put up a TCP/IP mailbox here in Geneva and
would like to know how that goes along with a f6ffb box too.
Thanks for any help !

799. re: NTS traffic on packet

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-03-29 15:01:46 UTC
From: ostroy@cbnewsh.cb.att.com
Message-ID: <CnFLr1.Hu8@cbnewsh.cb.att.com>
Source record: 49793

Here's my two cents on a subject near and dear to my heart.

Tod|> I am advised by local packet network managers and the local NTS
Tod|> representatives that NTS traffic fares poorly on the packet network. The
Tod|> problem is one of "culture"
Tod|> The traffic culture was built around HF operations - originaly spark, then
Tod|> cw , then voice and cw. When digital modes appeared, particularly AMTOR,
Tod|> the NTS began to incoporate that mode for traffic. The traffic culture is
Tod|> based upon one person handing traffic to another and the second person
Tod|> agreeing to forward or deliver the traffic. The Q-signals reflect this
^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^
That's the key. in the old NTS, the recipient, by virtue of taking traffic,
agrees to "forward or deliver" . A destination bbs, by contrast, has no
obligation to forward or deliver. It simply waits for someone to "come
and get it". It could wait forever.

Hank>It is not "sent to a callsign", nor is it "placed in a file", it is sent
Hank>to a zipcode, and is then picked up and delivered by *any* NTS person who
^^^^^^^^^^^^^^^^^^^^^^
picked up by who? There are not that many people interested in picking
up messages off a bbs and delivering them to the general public.

Hank>wishes to do so. If any NTS message is "stuck" at some BBS, the problem
Hank>lies with the NTS organization. One needs to think of the packet BBS system
Hank>just like any other transport system. It needs to be serviced.

Very true, but in reality, both Tod and Hank have said the same thing.
Although the mechanism is there to move traffic on packet, the culture
is not.

Tod|> Most BBS operators implore those who check in to look at the accumulation
Tod|> of NTS messages and accept one or more that they are willing to relay or
Tod|> deliver. The problem is that there is not a habit pattern or culture
Tod|> that has grown up within the packet community to accept such activity as
Tod|> something of interest. In some cases, the persons checking in may not have
Tod|> HF priviledges that permit them to off-load the messages to the local
Tod|> traffic nets.

Hank>This is an NTS problem, not a packet network problem.
Hank>Why would one offload NTS traffic onto HF? This is exactly what the BBS
Hank>system is good at; moving bunches of traffic from point A to point B
Hank>without error for any user who wishes to use it.

In my area, the vast majority of traffic which is removed from the bbs'
is brought to a 2meter or 80/75meter net for delivery. This is because
there are just not enough interested message deliverers to cover an

entire section or state.

Hank, the problem is that messages are not sent to a specific "user" at
the receiving end. They are broadcast. Messages sent to some destinations have about as
much chance for success as a CQ on 10 meters at
the sunspot nadir. In the old NTS, all messages are handed to a specific
user, the next person in the pipeline, until the last person is reached.

Tod|> In summary, this is an interesting situation which perhaps offers an
Tod|> opportunity for public service. If such a culture were developed, it would
Tod|> be in place ready to go in the event of an emergency. Regrettably, to date
Tod|> the right ingredients have not come together.

Hank>The opportunity has been there for ten years now. The BBS system has
Hank>worked in the same way with respect to NTS traffic since at least late
Hank>1984. NTS has failed totally to take advantage of the resource available to
Hank>them, at least in most areas of the country. NTS must understand that the
Hank>average BBS sysop is *not* part of NTS, and has *no* particular interest in
Hank>NTS messages per se. These messages are treated like any other traffic;
Hank>moved to their destination by the quickest method possible. They key thing
Hank>that NTS *must* do to make use of the network is to assign liason staff to
^^^^^^^^^^^^
a great idea ...IF you can find enough interested people.

Hank>the network. This has been done since 1986 in New England, and it works
Hank>fairly well. Speaking for the area in which I now live, NTS folks are

Frankly, if your sole traffic-handling activity is just picking messages
off a bbs that you can deliver toll-free, you are going to get bored
real quickly. The NTS "culture" has been built for years around
participation in the pipeline, as an integral part of it. The packet bbs
system has taken away the pipeline from the NTS'er and left nothing but
simple unchallenging user interfaces at either end. No wonder NTS'ers are
not interested. It's going to take a long time to develop a culture
of message deliverers, as opposed to traffic network operators.

(By the way, I participate in both facets of the hobby, lest you
suspect bias.)

800. Re: NTS traffic on packet

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-03-29 15:58:11 UTC
From: jms@col.hp.com
Message-ID: <2n9j6k$db9@hp-col.col.hp.com>
Source record: 49794

This reply is directed to anyone who is taking part in this discussion. I am heavily involved in traffic handling and I will use any mode to pass it, although my primary interest is CW. Here's how I would like to see the delivery end of NTS traffic over packet handled. You BBS sysops please let me know if it's possible with the current BBS software.

The problems I see with the end delivery of packet nts traffic are:

1. ANYONE can take the message and (attempt) delivery, even if they know nothing about traffic handling.

2. Some BBS systems do not allow a person to 'kill' a message once it's been read for delivery. I WILL NOT deliver traffic from such a board as it's embarrassing to attempt delivery when someone else has already done so.

3. If someone does not check in on a regular basis and check for traffic, it WILL sit and get stale.

I would like to see local Amateurs volunteer to be the end delivery operators for NTS traffic. Each person that volunteered would be sent ALL @ZIPCODE NTS traffic that comes in on their assigned day. Ideally, they would have a 24 hour personal BBS system that has auto-forward capabilities. If a person does not have a 24 hour station with auto-forward capabilities, it would be his/her responsibility to check the full service board on the assigned day.

So, can present BBs software be configured to forward nts traffic to a given station, preferably re-address it to that Amateur's call sign so they know there is messages waiting? Can it be set up to send it to a different person each day, with maybe a different person on odd or even weeks (don't want to leave out anyone who wants to play)? This is rather the way the NTS works. Only at the section level are people invited to randomly check into the nets. On all other levels, folks volunteer and are assigned a given function for a given time (NCS, liaison, etc.). This would have to be a function that would be performed automatically once the sysop set it up. The BBS sysops have enough work to do running their boards as it is. If present BBS software does not support such a function, what you you all think of the idea?

BTW, thanks to all the BBS sysops out there that keep the boards up and running. I know it's a big job and a lot of work.

Mike, K0TER

> NTS-type traffic?

Why? Traffic is traffic. It doesn't matter what the transport method is
if the ends aren't serviced.

> (2) I how much time, effort, and cost is involved in running a BBS?

A lot. And the only real payoff is in the self satisfaction of providing
a useful service. (Or fulfilling some inner masochistic tendancies.)

> At the same time, though, I would hope some compromise/working
> solution can be found between NTS and BBS operations, which
> is what prompted me to post.

As Hank said, it's not the transport, it's the service at the ends.

As I said earlier, there is a large amount of friction to packet BBS
"assistance" to NTS traffic. Since awards for traffic handling is in
the number of messages handled, (Brass Pounders Award) it's fairly
obvious that an un-attended automatic system can handle orders of
magnitude more traffic than any human can. (Voice or CW) And as a
result of this, some (non-automated) NTS personal have pitched a fit
about packet BBS forwarding of NTS traffic.

What needs to be done (since awards seem to be the driving force in
any amateur endeavor) is to promote an award for messages deliverd.

Watching NTS traffic being sent by hand person to person across the
country is like watching John Henry competing against the steam hammer.

Now, before you all go berserk and read into this that I wish to abolish
hand operation or (gasp) CW, all I'm asking is that people become more
aware of the various methods (and efficiencies) available.

I'm positive that there are areas that are best serviced by CW, and as
such, that capability and training needs to be promoted. But there is
a huge amount of NTS traffic that can best be moved coast to coast via
the packet BBS network.

By the way, wa6fwi bbs handles the 9050x zip codes. Every once in a
while, there will be "New mail has arrived for NTS-in" on the screen.
I deliver the message and ask if they would like to send a reply.

With all due respect, the first 2 sentences are total poppycock. I
can just imagine the looks I'd get telling PBBS sysops that there
has been an "implied" .ampr.org stuck on the end of their addresses.
So, as coordinator for the ampr.org namespace in Minnesota, should
I be registering all the PBBSs in the state ?

> The actual problem we wish to solve by using "NOAM" instead of

> intended when they made the addressing blunder.

Let me get this straight - amongst the many myopic, NIH-based
decsions made during the evolvement of the PBBS network (including
left-to-right parsing - hence the subject of this thread) was one
to use a top-level designator that was already used in a different
domain - and then blame the users for the confusion that arises..

Let's face it, namespaces (like routes) are always leaky in practice -
if you choose to ignore that fact during the design phase, I fail
to see how shifting the blame to the users helps.

Gad! What do you think a packet BBS is, a major internet node on
T1 trunks? An original IBM AT (8 MHz 286 with a 20 Mb hard disk)
is beaucoup plenty computer to deal with the 1200 baud half duplex
demands of VHF packet, or the 300 baud demands of HF packet. The
main thing the computer needs is *patience*, and machines, even
old machines, are good at that. What you do need is good radio
equipment, excellent antennas, and in the case of VHF a very
good high site for user access and forwarding. Likely you'll
have several radios on several frequencies for user traffic
and BBS to BBS forwarding.

>that this power-hungry computer (400 VA watts?) would be running
>24 hours a day, your time and effort in seeing that the computer
>and radio keep running. I suspect MUCH IS already being given
>by BBS operators as a service, but I'm just curious of the
>accounting.

The major cost of operating a full service BBS is *time*. It takes
hours a day to manage the system and deal with naive users. There
are routing databases to maintain, rewrite files to update, manual
rerouting of naive user Email attempts, etc, etc, etc. Many Sysops
keep spare radios and antennas, and spare computers, in order to
maintain service in the event of downtime due to equipment failure.
The wear and tear on the radio equipment is considerably higher
than what most amateur grade equipment was designed to withstand.
Since it's 24 hr operation, good lightning protection is a must.

I was unclear as to the intent of this message (i.e. the one
that supposedly listed the gateways and their callsigns...) but there
are several things wrong with it:

Many ham callsign databases do *NOT* list USA club stations! That is why
w6yx, w5gb, and wa7slg (you had "wa7sig") may not be listed.

Since many gateways *are* club stations at universities, it wouldn't surprise
me if a sizeable percentage of them simply didn't show up in some of the
callsign databases.

The buffalo server *does* have the club calls, as does that kind made from
smashed trees smeared with ink...

805. Packet Terminal Program for Amiga Computer

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-03-29 17:19:52 UTC
From: monsoor@nextnet.csus.edu
Message-ID: <2n9nvo$cgu@news.csus.edu>
Source record: 49799

I have an Amiga 2000 computer and have just purchased the MFJ1278B and software to talk to the TNC. I find that what is lacking the the software is the terminal emulation for connecting to FBBS's to transfer files (YAPP, ect).

Does anyone know of any programs for the Amiga that will allow me to transfer files and even work with the FBBS bulletins that are posted (capture, selected topics).

I know that I can get them for the IBM, and I do have the 286 BridgeBoard in my Amiga running, but I wanted to find a program for the Amiga.

Thanks in advance, Matthew

Rick Whiting (Rick_Whiting@ATK.COM) wrote:
: surprised CLOVER did not do better.] Based on this and other
: published data, the throughput (CPS) for various protocols on HF
: would appear to line up as follows: AX.25 Packet 4, AMTOR ARQ 5,
: RTTY 6, PacTOR 9-10, CLOVER 16, and G-TOR 24.

: By the way, I don't think the Kantronics KAM used in Westhuizen's
: tests implemented hardware ADC Memory ARQ. Furthermore, the

No, it doesn't. But it's debatable how much difference that makes. Kantronics says they haven't been able to measure a difference, although they also say their testing hasn't been extensive on this point.

: various throughput data cited above were not taken by the same
: experimenters under similar conditions, etc.

Right, which makes the comparison very much apples and oranges. Given the massive variations in HF conditions fram band to band, location to location, season to season and, often, minute to minute, you need a lot more data than this to make any useful comparisons! Plus, three of these protocols are adaptive. (Clover is bit-rate adaptive, PACTOR and G-TOR are bit- and symbol-rate adaptive.) Thus it is crucial to factor in the channel conditions, since throughput will vary, probably non-monotonically, with channel degradations of various types and combinations. That way, you can determine which protocols favor which propagation conditions, and by how much. Or you can factor *out* the channel conditions by taking a lot of data that span the (reasonable) range of channel conditions to get a "figure of merit" for each protocol. But since none of that has been done--or published, at any rate--the conclusions you can draw from the given data are nonexistant.

And the term "throughput" itself is a bit slippery here. How do you count the characters that RTTY or AMTOR "receive" but which are not the characters that were sent? Seems unfair to the protocols that provide data integrity to count garbled characters the same. Bottom line: comparing error-free protocols with RTTY/AMTOR is comparing not just apples and oranges, but two entirely different food groups!

That said, there is plenty of evidence, both analytical and empirical, that suggests that any non-adaptive, non-FEC protocol is going to perform worse on HF, in general, than an adaptive protocol with FEC. Plus, I suggest that any protocol that allows undetected errors in reception is a nonstarter for serious HF communications in the 1990s. (Although they are fun to play with, and I certainly don't discount that.) Taking those two factors together, I suggest that the protocols

whose throughput is of interest are PACTOR, CLOVER and G-TOR, in no particular order. The others are suitable only for play.

: Of course, there are many features that differentiate the different
: protocols beside typical throughput, not the least of which is
: throughput normalized to bandwidth, i.e., CPS per hertz. And the

Yes, and isn't it interesting that the one with the widest bandwidth supports the lowest throughput? (Even though the data above isn't particularly useful, I feel confident in saying that any test under conditions other than excellent will show AX.25 to be a loser.)

|> NTS-type traffic?

Hardly.

NTS traffic has consistently been less than 1% of overall traffic.
i.e. it is down in the noise to any sysop running a major linking
BBS - it just rides along top of the "real" traffic.

|>
|> (2) I how much time, effort, and cost is involved in running a BBS?

A full service HF capable system can be put together for less
than $5,000 if one is willing to make quite a few sacrifices
in performance. A more reasonable estimate would be $10,000
total cost (computer, radios, tower(s) and antennas, tncs, etc).
This assumes a system with two or three backbone links (ya gotta
get the traffic from point A to point B somehow), two user ports
(the NTS folks need to talk to your system), one primary HF port
with (at minimum) a tribander plus trap dipole. You will also
need some spares: things break and need to be replaced.
You need a top of the line HF radio. A computer (386 or 486) with
130 - 325 Meg hard drive and 8 MB RAM will handle things nicely.

That said - it *is* possible to do the job with less, but you
will end up doing a fairly poor job. The system needs to be able
to make links on HF even when conditions are crappy, so it needs
to be an *excellent* HF system to be effective.

Properly set up, such a system will run well with an hour
or less of your time (each day!) required to keep it running.
Most of this time will be spent answering messages ("Your signal
was real weak on 40M last night, did the antenna tuner break again?",
"There are three NTS messages on your stupid system that have not
moved FOR OVER TWO HOURS. Is your connection to Lower Slobovia
working at all, or should we use the TELEPHONE?") and tending to
mis-addressed traffic ("Darn, that idiot STILL thinks Los Angeles
is in Northern California, GACK!").

Oh yes, you will use some electricity - but this cost is minor
compared to the cost of replacement radios, tncs, HF rigs, antennas

("Darn storm blew down the tribander again, better call AES and have them ship UPS Blue"), power supplies, etc.

You *will* have emergency power, won't you? A system dedicated to NTS will not be of much use if it is not on air when an actual emergency strikes. The cost of that 2.5 - 6.5 KVA Honda was included in my cost estimates.

Sounds a bit daunting? Hardly. Any ham with a fairly new HF rig and good antenna already has a good part of this system.

However, with this kind of investment, it would seem silly to have it sit idle over 99% of the time - just so it could handle the tiny bit of NTS traffic seen. The system will indeed be busy almost 100% of the time, handling traffic *other* than NTS. Then, when that NTS traffic comes along, the links will be in place, the routes will work, and the sysops you connect with will be ready to handle it.

Oh yes - there IS one little problem. How will you convince the NTS folks to USE this system? We ain't solved that one yet.

I would recommend that you contact your local frequency coordination council
and ask how to get ahold of the 6 meter coordinator. It is likely that the
local band plan is a little different from the ARRL band plan, and you
really want to fit in with the local plan. I was under the impression that
51.7 was a packet freq., but I'll have to go look in my notes. The band plan
seemed to have a lot of duplex pairs for packet, which did not make much sense
to me (hidden transmitter problems are somewhat less on 6 meters; I'd expect
full duplex on 2 meters, 440, etc. before 6 meters).

Apologies for the Newbie question, but...

I am thinking about trying to set up NOS on the Club machine here at
MSU. I think I can figure out how to get the software set up, but I
have three questions:

1. Where do I get an IP address for our machine?
2. Where do I get a host file so that our machine knows about
others on the net?
3. How do I propagate our IP address and hostname so that other
systems know about it and where it is on the net?

Thanks for any help. Responses via email are fine.

/Matthew

I have been monitoring some "utility" signals using an AEA PK232-MBX,
and have run across many strong signals that the PK232 cannot decode.
These sound like ordinary two-tone FSK RTTY signals.
They are often, but not always in the HF maritime bands (6, 8, 12, etc.
Mhz), and the signal identification feature on the PD232 shows
75 baud and mode "unknown". I hear these signals with both narrow
and wide shifts. Anybody know what they are? A special code for an
Oriental language? Encrypted data? Something altogether else? Anybody
know how to copy them?

Tnx es 73,

Yes, the tones are different amplitude because they are not centered in the rig's bandpass.

I remember running into this years ago on my old sb-100, and what I did was to get another crystal for the carrier generator and switch between it and the usual lsb crystal. These days on my FT767GX all I do is select FSK mode.

The XR-2206 is made by EXAR, and is a monolithic function gernerator. It
makes a sig generator - it can make sine, square, triangle, ramp and
pulse waveforms.

I don't know of any crosses, but most electronics wholesalers ought to be
able to supply EXAR ics.

Hi,

Chip by EXAR Corporation is function generator/FSK generator, whatever.
Used to generate the varying frequency required in SSTV and FAX signals.
Write to EXAR, can't remember where I put the address though :) Sorry

Randy Jarrett, WA4MEI, is the Ga state packet frequency coordinator
under SERA. Email to rsj@wa4mei.atl.ga.us for bandplans and coordination.

Hidden transmitter problems are even more severe on 6 meters due to the
nature of the propagation of the band. The duplex pairs are designed for
non-contending trunk service. That gives the much higher effective throughput
needed for trunking service.

We're using it, or trying to. However,I still feel nervous about 'throwing
a message at the packet nts system', instead of handling it myself.
More reliability in the system might help. Or better yet, enhanced
delivery systems. Here's what I responded to on another posting:

This reply is directed to anyone who is taking part in this discussion.
I am heavily involved in traffic handling and I will use any mode to
pass it, although my primary interest is CW. Here's how I would like to
see the delivery end of NTS traffic over packet handled. You BBS
sysops please let me know if it's possible with the current BBS
software.

The problems I see with the end delivery of packet nts traffic are:

1. ANYONE can take the message and (attempt) delivery, even if they
know nothing about traffic handling.

2. Some BBS systems do not allow a person to 'kill' a message once
it's been read for delivery. I WILL NOT deliver traffic from
such a board as it's embarrassing to attempt delivery when
someone else has already done so.

3. If someone does not check in on a regular basis and check for
traffic, it WILL sit and get stale.

I would like to see local Amateurs volunteer to be the
end delivery operators for NTS traffic. Each person that volunteered
would be sent ALL NTSXX @ ZIPCODE NTS traffic that comes in on their assigned
day. Ideally, they would have a 24 hour personal BBS system that
has auto-forward capabilities. If a person does not have a 24 hour
station with auto-forward capabilities, it would be his/her
responsibility to check the full service board on the assigned day.

So, can present BBs software be configured to forward nts traffic
to a given station, preferably re-address it to that Amateur's

call sign so they know there is messages waiting? Can it be set up to send it to a different person each day, with maybe a different person on odd or even weeks (don't want to leave out anyone who wants to play)? This is rather the way the NTS works. Only at the section level are people invited to randomly check into the nets. On all other levels, folks volunteer and are assigned a given function for a given time (NCS, liaison, etc.). This would have to be a function that would be performed automatically once the sysop set it up. The BBS sysops have enough work to do running their boards as it is. If present BBS software does not support such a function, what you you all think of the idea?

BTW, thanks to all the BBS sysops out there that keep the boards up and running. I know it's a big job and a lot of work.

Thanks, Jeff. Actually I understood that the above routing can be
accomplished. But, can you do that and make it change on a daily
basis? E.G. on Monday the traffic is forwarded to me, on Tuesday
it goes to N0HAM, on Wednesday to KB0XYZ, etc. And maybe have it
so it works on a bi-weekly basis, depending on how many people a
given area has that wants to deliver traffic. So I might get all
the 809xx @ ntsco on Monday of the first and third weeks of a month,
and someone else get it on the second and fourth weeks.
What do you think?

I HAVE A 386 SX COMPUTER & EGA COLOR MONITOR.

I AM LISTENING TO 2 METER ACTIVITY, AREA REPEATERS, WITH OUTSIDE
1 ELEMENT QUAD ANTENNA. I GET STRONG QRM FROM COMPUTER IF
RECEIVER OR COAX IS WITHIN 10 FEET OF CPU.

ANY IDEAS? OR SUGGESTIONS?

The real problem with the "reliabilty" aspect of forwarding is that there
are a few self appointed problems in the forwarding network. The software
for the most part is reliable (assuming that the sysop took the time to
read the manual.)

> This reply is directed to anyone who is taking part in this discussion.

> such a board as it's embarrassing to attempt delivery when
> someone else has already done so.

JNOS (wg7j main author) allows anyone to kill mail in an area with NTS
prefacing it. (Areas as opposed to listing by topic)

My system has an area called NTS-in that has all the 9050x traffic in it.
There is another area (hidden) called NTS-out that is used as a buffer
between forwarding cycles.

So there are three catagories of areas now on my system, private (you
have to be that person to read/kill) public (anyone can read, but sysop
only to kill) and NTS (anyone can read and then kill).

> So, can present BBs software be configured to forward nts traffic
> to a given station, preferably re-address it to that Amateur's
> call sign so they know there is messages waiting? Can it be set
> up to send it to a different person each day, with maybe a different
> person on odd or even weeks (don't want to leave out anyone who
> wants to play)?

A simple entry in the alias file will forward to whomever. so if I
alias 90505 to kf6pu@wb6ymh.#soca first the alias file redirects it

to kf6pu, the my rewrite file queues it up for delivery to the wb6ymh bbs.

If desired, the rewrite and alias files can be swapped out on a regular basis to dump traffic to different users (servicers).

> BTW, thanks to all the BBS sysops out there that keep the boards
> up and running. I know it's a big job and a lot of work.

It is, but it is one of the ways to return something to the hobby. I'll leave it to some of our other members to do the take-take-take routine.

823. Re: NTS Only BBS? (was Re: [REPOST] NTS Traffic on Packet)

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-03-30 16:00:12 UTC
From: enge@enge.almaden.ibm.com
Message-ID: <2nc7mc$m6c@juniper.almaden.ibm.com>
Source record: 49818

The trick is to get the NTS message delivered. There is no problem moving the messages from one place to another.

In my case, NTS passes thru my BBS but I don't handle any for delivery. Several local hams said they would handle NTS delivery but then got bored with it and never picked up the messages so I arranged to have another BBS handle my zip code.

Hi,

I have some memory chips that I need more info on. Specifically, I
have these chips:

KM41C1000AJ-8
KM41C1000BJ-8 Is this really different from the AJ?
KM41C4000AJ-8
M5M44410AJ A Mitsubishi chip

I am reasonably sure the first two are 1Mbit x 1 chips. I hope the third is a
4Mbit x 1 chip. I hope the fourth is also a 4Mbit x 1 chip, but fear it is a
1Mbit x 4 instead. I intend to use these chips in having some SIMMs made up
for a PC.

In a somewhat related topic. Do any of these companies that build
SIMMS from "your" chips offer to remove the surface mounted chips from existing
PC boards?

TIA,

It's made by EXAR and is very common. Jameco Electronics (1-800-237-6948)
lists it as part #34972 and sells it for 3.75 in quantity 1. Jameco's
address is 1355 Shoreway Road, Belmont, CA 94002-4100.

> the 809xx @ ntsco on Monday of the first and third weeks of a month,
> and someone else get it on the second and fourth weeks.
> What do you think?

To do the specific person to service NTS messages, you can change a line in the alias file to read "90504 nts-in w0rli" This allows a local copy on the BBS and a forwarded copy to Hank. The key would be having several ALIAS files and then swapping them out as required. I.e., copy alias.001 alias and so forth. with alias.000 being the default (none forwarded version) to return to. Creative use of the AT command can accomplish this on a fairly regular basis.

If on the other hand you are one of those people that reset the BBS daily for memory purposes, you can write a batch file to include renaming and copying the alias files.

How it works:

ALIAS file for wa6fwi (relevant portion)

```
# this allows a carbon-copy of all NTS traffic sent
nts-out nts-out sent-nts
# this grabs incoming from my forwarding BBS and places it in nts-in
90500 nts-in
90501 nts-in
90502 nts-in
90503 nts-in
90504 nts-in
90505 nts-in
90506 nts-in
90507 nts-in
90508 nts-in
90509 nts-in
```

REWRITE file for wa6fwi (relevant portion)

```
# this grabs things in the "correct" format for forwarding.
*@nts* nts-out
```

I have had problems in the past with people sending NTS mail
addressed to (for example) 90504@90504 or NTS@90504.CA and
other seriously hosed up versions. Usually when I catch them,
I service the message and send a note back to the originator
and the originating BBS sysop explaining how it should be done.

831. Talking to seismic packages over a radio link

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-03-30 22:17:47 UTC
From: sak@igloo.essc.psu.edu
Message-ID: <SAK.94Mar30171748@igloo.essc.psu.edu>
Source record: 49824
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.misc,comp.sys.palmtops

Hi all, a novice question on radios and radio-modem links.

I have an experiment where a bunch of seismic packages (refteks) are scattered over the Antarctic ice sheet. They are all within about 40 km of a central site. I would like to interrogate them about their state-of-health from this central site. I don't need a high-speed link (I am not downloading seismic data over the radio, just some relatively small strings of data).

The refteks usually are interrogated by walking up to them, hooking up a little hand-terminal with an rs-232c connection and sending queries and getting back answers. This is a full-duplex connection.

I would like to use VHF radios at approx 10W and a good antenna/tower to get the distance, and get the same functionality, but from the comfort and luxury of my central hut.

My questions:

1. Are there radio transceivers out there that will operate in full-duplex. i.e. transmit *and* receive at the same time, over two different frequencies?

2. Are there modems out there that will work seamlessly with above radios?

3. Are the modems "intelligent". i.e., I want to be able to say "station 6, tell me foo", and only the modem at station 6 passes on the request to the seismic package, and replies with the response. I can't program the refteks to "know their name" --- the refteks are off-the-shelf.

4. I also need to be able to say "all stations, start recording NOW", without having to cycle through "station 1, start", "station 2, start", and on down the list. This is a timing matter. I want to have all the stations turn on at the same time to record an event.

5. And finally, how much approx for each radio/modem? And any pointers on who sells these things would be much appreciated.

6. Some people have said that I can't expect to just walk into Bob's Radios and walk out with a radio. That there are all sorts of FCC this-n-that before anybody will sell me anything. Is that the case? Please note that this is a *solely* Antarctic project, and will not be used in the US.

I appreciate any and all help you can give me. I am not
radio-literate, or modem-litereate, for that matter, so excuse the
ignorance of my questions.

Any and all help gratefully accepted.

Cheers, Sridhar.

833. HF Throughput Revisited

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-03-30 23:17:41 UTC
From: Rick_Whiting@ATK.COM
Message-ID: <9403302317.AA09294@ATK.COM>
Source record: 49826

Subject: Time:4:44 PM
OFFICE MEMO HF Throughput Revisited Date:3/30/94
Jon Bloom commented on my earlier posting where I listed some data on HF throughput for various modes, in particular my statement "various throughput data cited... were not taken by the same experimenters under similar conditions, etc., as follows:

"Right, which makes the comparison very much apples and oranges. Given the massive variations in HF conditions fram band to band, location to location, season to season and, often, minute to minute, you need a lot more data than this to make any useful comparisons! Plus, three of these protocols are adaptive. (Clover is bit-rate adaptive, PACTOR and G-TOR are bit- and symbol-rate adaptive.) Thus it is crucial to factor in the channel conditions, since throughput will vary, probably non-monotonically, with channel degradations of various types and combinations. That way, you can determine which protocols favor which propagation conditions, and by how much. Or you can factor *out* the channel conditions by taking a lot of data that span the (reasonable) range of channel conditions to get a "figure of merit" for each protocol. But since none of that has been done--or published, at any rate--the conclusions you can draw from the given data are nonexistant."

My comment on Jon's comment:

It happens that Westhuizen's data for CLOVER II and PacTOR were based on a longitudinal test on 40 M. Also, his results for PacTOR are nearly identical to those reported by Anderson, et al, for G-TOR vs. PacTOR. Thus, there is some cross calibration of test results. While all the caveats I mentioned in the original posting (and which were elaborated upon by Bloom) certainly compromise the comparison, I'm not so sure the relative relationships cited are all that meaningless.

Again, the data were offered to generate discussion. Does anyone have any better data (or even other data) or basis for comparison? Reply by e-mail and I will summarize. 73/Rick W0TN <rick_whiting@atk.com>

Do you have any cables from PC to radios or controllers? If the power supply
is generating RF, it can travel down the outside shielding of serial/parallel
cables, ribbon or shielded. If so, try wrapping around ferrite toroid. This
was my problem and solution for old original PC RFI many years ago when
connected to TNC
73 de N9HMO.

Archive-name: radio/rec-radio-info/welcome
Last-modified: $Date: 1994/01/02 22:00 $
Version: $Revision: 1.06 $

*** Welcome to rec.radio.info! ***

Welcome to rec.radio.info, a group that aims to provide a noise-free source
of information and news for the entire rec.radio hierarchy.

Two introductory articles about rec.radio.info are posted to the group and
to news.answers every two weeks. You are now reading the first article, which
explains what rec.radio.info is, and answers some Frequently Asked Questions.
The second article is titled "Submission Guidelines", and you only need to
read it if you want to submit an article to rec.radio.info.

You can skip to the next section of this article by searching for the next
" -- " string. The sections available are:
- What is the purpose of rec.radio.info?
- Why are messages almost always cross posted to rec.radio.info?
- What is a 'follow-up', and what does 'moderated' mean?
- OK, so now I know what 'moderated' means. Tell me more.
- What type of material is considered inappropriate?
- I do not have access to news, how can I get the information posted to
rec.radio.info?
- Will the material appearing in rec.radio.info be archived somewhere?
- I have a regular posting with timely information, is there a way to
speed up it's delivery, or automate for more convenience?

-- What is the purpose of rec.radio.info?

The purpose or charter of rec.radio.info is to provide the Usenet community with
a resource for information, news, and facts about any and all things radio.

All the other rec.radio groups are intended for discussions and general chit
chat about radio. Rec.radio.info will contain informational, factual articles
only. Follow-ups are redirected to an appropriate other group, and further
discussion (if any) will not take place in rec.radio.info.

In order to ensure that rec.radio.info contains only appropriate articles, it
was decided to create the group as a moderated newsgroup.

-- Why are messages almost always cross posted to rec.radio.info?

It provides a "tag" for each article to be assembled into a filtered
presentation in rec.radio.info (even with cross-posting, only one message, with
```

a unique Message-ID, is propogated across the net). This tag also facilitates a pre-existing method of dropping or cancelling the articles locally within the discussion groups if you don't want to see them. This accommodates individuals who want to separate the bulletins from the discussions, discussions from the bulletins, as well as those who are adamant about not reading another newsgroup and wanted to see everything all in one basket.

With the total size of Usenet (in number of newsgroups and total traffic) doubling every year or so, this is no insignificant contribution to reducing information noise and chaos. Making the discussion groups a catch-all, and making extra newsgroups filters on that catch-all, is also the most realistic way to implement such a scheme (It's not intuitively obvious what the charter, contents, and general appropriate topics for each and every newsgroup are. Seeing FAQ's and charter/intro postings in the home newsgroup is beneficial for new readers).

By cross-posting one only is adding a few tens of bytes to each bulletin (to specify the extra group on the Newsgroups line), but are adding the capability for very powerful filtering features available on most news servers, listservers and readers. Your local news guru could probably explain these features in more detail.

In rn, for example, according to Leanne Phillips in her rn kill-file FAQ, add a line of the form:
/Newsgroups:.*[,]rec\.radio\.info/h:j
either in ~/News/KILL (if you don't want to see rec.radio.info articles anywhere) or ~/News/rec/radio/amateur/misc/KILL (if you don't want to see them just in rec.radio.amateur.misc). The latter method means your kill file will only be consulted during rec.radio.amateur.misc (and hence runs more efficiently), and will probably work for most people.

In nn, according to Bill Wohler in his nn FAQ, add a line of the form:
rec.radio.info:!s/:^
in ~/.nn/kill (if you don't want to see rec.radio.info articles anywhere), or put the following lines:
sequence
rec.radio.info
rec.radio.
at the end of ~/.nn/init in order to see all the rec.radio.info bulletins first, then read the remaining rec.radio.* without the bulletins.

-- What is a 'follow-up', and what does 'moderated' mean?

If you are new to Usenet and are not familiar with the terminology, you might want to read the general introductory articles found in the newsgroup news.announce.newusers. Doing so will make your life on the net much easier, and will probably save you from making silly beginner's mistakes.

If you think that at this moment you are reading an echo, a conference, or a bulletin board, I'd also strongly suggest a trip over to news.announce.newusers.

For the rest of this article, I will assume you have a basic knowledge of Usenet terminology and mechanics.

A moderated group means that any article that needs to be posted to the group has to be accepted by the moderator of the group. Since we need to ensure that followups to an article (discussion) do not show up in the rec.radio.info newsgroup, the `Followup-To:' header line contains a newsgroup that is appropriate for disussions about the specific article.

-- OK, so now I know what 'moderated' means. Tell me more.

Rec.radio.info is a moderated newsgroup, which means that all articles submitted to the group will have to be approved by the moderator first.

The current moderator of the group is Mark Salyzyn. Submissions to rec.radio.info can be posted, or e-mailed to:

rec-radio-info@ve6mgs.ampr.ab.ca

Comments, criticisms, suggestions or questions about the group can be e-mailed to:
rec-radio-request@ve6mgs.ampr.ab.ca

But before you do so, please be sure to check out the "Submission Guidelines" article.

The influence of the moderator should be minimal and of an administrative nature, consisting chiefly of weeding out obviously inappropriate articles, while making sure correct headers etc. are used for the appropriate ones.

-- What type of material is considered inappropriate?

There are three broad categories of articles which will be rejected by the moderator:

1) Requests for information: rec.radio.info is strictly a one-way street. I receive information in my mailbox; I then post it to rec.radio.info. Requests for specific information belong in the normal discussion newsgroups. If your request gets answered, you might consider passing the answer on to rec.radio.info, though. Especially if you can edit it into a informational, rather than a discussion, format.

2) Obvious discussion articles, or articles that appear unsubstantiated.

3) Commercial stuff: a relatively unbiased test of a radio product would be accepted, but any hint of for-profit might be reason for rejection. For three reasons: This is not the purpose of the list, for-profit is a controversial topic, and this list may be passed onto Amateur Packet Radio (where for-profit is prohibited except under certain provisos).

rec.radio.swap (or possibly comp.newprod) may be more deserving of the posting in any matter.

Similarly, copyrighted material generally cannot be used. If it's TRULY worthwhile to the net, I would recommend obtaining permission from the copyright holder. Please note the source, and if permission was given. I

reserve the right to make the final decision concerning appropriateness in all situations. In most cases, a brief summary of, or pointer to, the copyrighted information may be all I can allow.

-- I do not have access to news, how can I get the information posted to rec.radio.info?

brian@UCSD.EDU (Brian Kantor) has kindly supplied a mail list server for rec.radio.info. Non of the articles will be digested, due to their size, so you will receive individual mailings for every article posted to the group.

Mail sent to radio-info@ucsd.edu will be forwarded to the moderator and thus is an alias to rec-radio-info@ve6mgs.ampr.ab.ca

To subscribe and unsubscribe via the listserver; the format for that is

sub address radio-info
unsub address radio-info

where 'address' is your full mailing address. Send this request to

listserv@ucsd.edu

Note that the server will automatically delete any address that bounces mail. If you leave the address portion blank, it will try to deduce your address from the mail headers. This may not work if you are on bitnet, milnet or some other non-Unix host, so it is recommended to put your return address in any case. For example:

sub mymailbox@myhost.mydomain.mil radio-info
or
sub MEMEME01@DMBHST.bitnet radio-info

or something like that.

-- Will the material appearing in rec.radio.info be archived somewhere?

Yes. Still firming up details at the moment but here is a preliminary list:
- unbc.edu as maintained by Lyndon Nerenberg <lyndon@unbc.edu>
- nic.funet.fi maintained by Risto Kotalampi <rko@cs.tut.fi>
saved to /pub/dx/text/rec.radio.info currently stored as numbered files.

Effectively this means that anything you post to rec.radio.info will be permanently stored, so your work will not be lost.

-- I have a regular posting with timely information, is there a way to speed up it's delivery, or automate for more convenience?

Yes, there is! It may take a bit of chatter with the moderator, but we are willing to take responsible people and provide them the means of posting the articles directly from their site. We will try everything we can as we fully realize that DX (distant signal) and astronomical data can be somewhat transitory. We are also willing to allow regular posters of information the same courtesy, even if the information is not as time critical.

We refer to this as self-moderation, which is partly based on the model for news.answer. This requires co-operation and good will to be beneficial to the community in the rec.radio hierarchy.

I suggest reading the posting guidelines for more information. I am open to suggestions.

I thank the following individuals for their input into this article:
rec.music.info moderator Leo Breebaart rec-music-info@cp.tn.tudelft.nl
rec.radio.broadcasting moderator Bill Pfeiffer wdp@gagme.chi.il.us
Paul W. Schleck, KD3FU pschleck@unomaha.edu
Ian Kluft, KD6EUI ikluft@uts.amdahl.com

zawada@softage.demon.co.uk (A Gnome On A Mission)

The XR2206 is a function generator. I've seen examples of it giving sinewaves, sawtooths and square waves. I think there are a few places you can get them. I'm not sure if they've been deleted or not because I've seen them in some pretty old schematics. I live in New Zealand but I can't suggest any American outlets, except maybe try Paia or Digikey (ie: the biggies). I know you can get them from "Farnell Electronics", Private Bag, Market Rd, Auckland, New Zealand, or in Australia there are several companies that could probably help, like Dick Smith Electronics or Rod Irving Electronics (sorry don't have a contact number for them).

Good luck in your search

Dean

839. Talking to seismic packages over a radio link

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-03-31 07:34:11 UTC
From: jangus@skyld.grendel.com
Message-ID: <765099251snx@skyld.grendel.com>
Source record: 49832

In article <SAK.94Mar30171748@igloo.essc.psu.edu> sak@igloo.essc.psu.edu writes:

> The refteks usually are interrogated by walking up to them, hooking up
> a little hand-terminal with an rs-232c connection and sending queries
> and getting back answers. This is a full-duplex connection.

Hypothetical case (so the net cops and armchair lawyers stay quite):

Connect all the sensors to a small low power TNC (Terminal node controller)
for example a Kantronics KPC-3. Use a small two watt radio like a Tekk
KS-900 radio crystalled up with a 5 MHz offset between TX and RX somewhere
in the 450 MHz band. Give each TNC a distinctive name such as A0AA A0AB
A0AC etc. Put a small tower up at your hut location and set up a matching
radio with a reverse pair of TX and RX frequencies. Connect this to another
TNC and connect that to your computer.

Now, when you issue a connect request to one of these remote TNCs, you will
get connected to the device connected to it's rs-232 port. Just like being
there, except you're nice and snug and drinking coffee and vodka. Once you
get the data you need, issue a disconnect and go on to the next sensor/TNC
pair.

Now one of the reasons for using the split frequency is so that each radio
at a sensor only have to listen to the base transmitter, not each other.
This should eliminate the hidden transmitter effect of a wireless network.
By the same token, the base transmitter will hold off if the base receiver
can hear ANY of the sensor transmitters.

Even though the links themselves are really half-duplex, it will appear to
be a full duplex link for all intents and purposes to the sensors.

Hope this gives you some ideas on how to do what you want.

Jeff

Hi, please reply in mail only...

I am looking into the packet radio things lately, and think it is really
interesting. Could someone tell me what exactly I would need to set
this up. Maybe someone from Holland around?

I have an AMIGA 2000 computer, just running at 7Mhz. What extra hardware will
I need. Estimate costs.

You are right - the first 2 are Samsung 1M x 1 DRAM's 80ns - the BJ is
likely to be a mask revision or a die shrink to improve speed performance

The 3rd is a Samsung 4M x 1 DRAM 80ns

The 4th is 4M x 1 but you may have the pt no wrong - it should be
M5M44100AJ

FYI the Mitsubishi 1M x 4 DRAM would be M5M44400AJ

I have some good news for you! Yes, you can do it with off-the-shelf equipment, and even better news: There's a guy at McMurdo (Antarctica) who's done it! You want to get ahold of Al Oxton <oxton@atsvax.rsmas.miami.edu>. (or oxton@mcmurdo.gov) Tell him I gave you his name. He did something similar up here in New Hampshire using commercial radios with packet controllers. I was involved with the project just a little bit, but it was so many years ago, I've forgotten most of it. You don't need full duplex, btw.

There is a program called hamcom22. That is hamcom ver 2.2. It uses a real
simple interface that plugs into the rs232 port on a pc. The interface
comprises a single op-amp and a few passsive compnents. I have received
press and wx rtty with it, and it also does morse. Although it's quite
good fun to watch it do morse and spot when it makes mistakes.
The same interface can be used with a prog called jvfax to receive wefax.
That works really well!

Thanks, again, Jeff. Since you know a lot more about this than I do,
can you explain to me what usually happens when a message gets
forwarded by more than one route, thus delivery is attempted more
than once? That happened twice to me yesterday. One of the messages
came in about 12 hours later. On the other, I received 2 copies
at the same time. It was duplicated by a station in VA who forwarded
it to MO and CO. They then found their way, by different paths,
to Colorado Springs where they were forwarded to my pbbs (KPC-3).
I guess it's better to get 2 (or more) copies than for a message to
get lost, but it still bothers me to attempt delivery of a message
that's already been delivered. I don't think it impresses the
general public much either!

****
Internet / Packet Radio BBS Gateways

There are currently two comprehensive gateways between the Internet and
the packet radio BBS system. One is run by Jim Durham, W2XO, in Pennysylvania
and the other, which allows access to PBBS bulletins, as well as mail,
is run by Bob Arasmith, N0ARY, in California.

2.4.1 The W2XO Gateway

To mail from Internet to Packet:

1. Mail to: "bbs@w2xo.pgh.pa.us"

2. Make the first line of the text a Packet BBS "send" command, ie:
SP TOCALL @ BBSCALL.ROUTING-HINTS < FROMCALL

3. The "subject" line of the Internet mail becomes the "title" line
of the Packet BBS mail.

NOTE: Because of FCC regulations, Jim must hand filter each message
sent FROM Internet TO the Amateur Packet Radio BBS system. Messages
should be of minimal length and appropriate content. Read Section 1.9
(Do's and Don'ts: Rules and Regulations) regarding appropriate usage of
packet radio for more information. Always include the routing hints
with the BBS callsign.

To mail from Packet to Internet:

1. The amateur radio operator must have his callsign registered in
the gateway alias list. If you want to mail from packet to a specific
amateur on Internet, send mail to 'durham@w2xo.pgh.pa.us' (Internet) or
'W2XO @ W2XO.#WPA.PA.USA.NOAM' (Packet BBS mail) with his/her amateur

callsign and their Internet address.

2. Once the above is accomplished, packet BBS mail should be sent to 'CALL @ W2XO.#WPA.PA.USA.NOAM'. The mail will automatically be forwarded to the Internet address of the amateur with the 'CALL' callsign.

Jim Durham's Internet address is 'durham@w2xo.pgh.pa.us'.

2.4.2 The N0ARY Internet mail <-> full packet BBS gateway

Bob Arasmith, N0ARY, runs a gateway between the Internet mail system and PBBS system. His gateway allows you to read, post, and respond to other postings on the PBBS system via email. For more information, send mail to gateway_info@arasmith.com.

> than once?

I service the messages that come in here myself. (Yup a BBS sysop with enough "spare time" to handle NTS traffic...) I keep copies of all the traffic. When I see what appears to be a dupe, I can verify it.

I would assume, that most of the people that service NTS messages do at least a scan of the traffic on a regular basis so that they too can spot a dupe when it comes through and kill it.

Here's the kicker, NTS messages are an excercise, not a commercial service. The whole purpose behind them was training radio ops in the technique of passing messages from one point to another. (And while doing so, get some good publicity for the amateurs in general.)

Remember, the RR in the ARRL is for Radio Relay. Apart from complaining and bad operating habits, passing messages *is* one of the oldest (and continously practiced) traditions of amateur radio. I for one am proud to be a part of it, and take personal pleasure from delivering messages.

> know how to copy them?

I believe that you will find these signals are encrypted. They are operating often in a synchronous rather than asynchronous mode. With out the keying material, you don't stand much chance of reading them. NSA probably is able to crack them. There are some Ship to Shore stations operating in these areas in the NAVTEX (AMTOR) fec mode. Your unit will read them nicely. There is also Ship to Shore ARQ which you can monitor..only problem being that the freq between shore and ship are split.

writes:
|>
|>
|> Here's my two cents on a subject near and dear to my heart.

...

|> That's the key. in the old NTS, the recipient, by virtue of taking traffic,
|> agrees to "forward or deliver" . A destination bbs, by contrast, has no
|> obligation to forward or deliver. It simply waits for someone to "come
|> and get it". It could wait forever.

Why would NTS use the system this way?

A BBS takes no action, it is a collection of radios, antennas, computers,
tncs, power supplies, etc. Only BBS *users* or BBS *sysops* take actions.
There are perhaps 50-100 times as many BBS users as there are sysops.
The "failure" of the BBS network with respect to NTS traffic lies directly
at the feet of the users; they fail to use what the system provides.
BBS sysops provide the means; BBS users make use of that means.

|> Hank>It is not "sent to a callsign", nor is it "placed in a file", it is sent
|> Hank>to a zipcode, and is then picked up and delivered by *any* NTS person who
|> ^^^^^^^^^^^^^^^^^^^^^^
|> picked up by who? There are not that many people interested in picking
|> up messages off a bbs and delivering them to the general public.

Picked up *by a user of that system* ... this concept cannot possibly
be all that difficult to understand. If "there are not that many ..."
then this is a failure of NTS, and not a failure of the BBS network.

...

You also miss the point.
The BBS system is a mechanism available to *any* person interested
in handling NTS traffic. In a sense, it is available just like 20
meters is available.

Please do *not* confuse the BBS sysop with the person moving the
traffic. The BBS sysop *provides a resource for anyone to use*.
His role is to manage the system; keep it on air, fix broken radios
antennas and computers, reboot the computer when the software fails,
and *see to it that messages go where USERS send them*.

It is up to the users to send the messages where they want them to go.

So if "NTS Person A" in New Hampshire wishes to send NTS traffic to
Oregon, they put it into the system addressed to 97xxx @ NTSOR.
The several sysops between NH and OR will see to it that this message
is moved to Oregon as quickly as possible. They will do this even though
they are *not* performing *any* NTS function. Once the message gets
to Oregon, *any* NTS person may take the message from the BBS system and
deliver it. It is that simple.

So for example - the system I run has about 150 users. Roughly ten of
them are NTS members, and will take traffic from the BBS and deliver it.
I personally have *nothing at all to do with NTS*. I simply make my
system available for NTS to use in any way it wishes.

What is so difficult to understand about this mechanism?

It is simple to use, works well when used as designed, and requires
ZERO work on the part of the BBS sysops.

If acknowledgments are wanted, the *NTS FOLKS* who enter the message
into the system and take it out of the system handle this in *any way they
want*.

...

|> In my area, the vast majority of traffic which is removed from the bbs'
|> is brought to a 2meter or 80/75meter net for delivery. This is because
|> there are just not enough interested message deliverers to cover an
|> entire section or state.

So how does the traffic get delivered then?
Person A picks it off the BBS system, passes it to person B, who then
delivers it. Why didn't person B pick it off the BBS system?

|> Hank, the problem is that messages are not sent to a specific "user" at
|> the receiving end. They are broadcast. Messages sent to some destinations
|> have about as much chance for success as a CQ on 10 meters at
|> the sunspot nadir. In the old NTS, all messages are handed to a specific
|> user, the next person in the pipeline, until the last person is reached.

Proves my point exactly: NTS has failed to organize.

And no, these messages are not "broadcast", if you think this is how things
work, you need to do a little reading and understand how the BBS network
actually works ...

In the old NTS, if nobody checked into the net, the traffic did not move.
The BBS system is *no different* than any other net: traffic is presented
to it, traffic is (or is not) taken from it and delivered.

...

|> a great idea ...IF you can find enough interested people.

"What you mean 'you' ???"

The correct statement is "IF NTS can find enough interested people."

|> Frankly, if your sole traffic-handling activity is just picking messages
|> off a bbs that you can deliver toll-free, you are going to get bored
|> real quickly. The NTS "culture" has been built for years around
|> participation in the pipeline, as an integral part of it. The packet bbs
|> system has taken away the pipeline from the NTS'er and left nothing but
|> simple unchallenging user interfaces at either end. No wonder NTS'ers are
|> not interested. It's going to take a long time to develop a culture
|> of message deliverers, as opposed to traffic network operators.

So? There are now new ways to move messages through the "pipeline".
Some folks will make use of these new capabilities, some will not.
If the NTS system as a whole does not, then it will probably die out.

The days of handling traffic on 80M CW are pretty much gone now, just
like spark, AM, and traffic nets which only convene for short periods
each day. We now have a capability which is error-free, available 24
hours per day, 365 days per year, and has proven capability of handling
many times the traffic that all of NTS handles.

For the curious: I've been licensed over 40 years.
Have handled NTS traffic on CW, AM, SSB (and many other modes).
Have ORS appointment.
Have a bunch of BPL certificates.
Think NTS is missing the boat.
Would like to see NTS move into the 90s.
Have no faith that might happen.

|>
|> 1. ANYONE can take the message and (attempt) delivery, even if they
|> know nothing about traffic handling.

This is always true - even on 20M - ANYONE can originate or deliver
an NTS message. So what?

|> 2. Some BBS systems do not allow a person to 'kill' a message once
|> it's been read for delivery. I WILL NOT deliver traffic from
|> such a board as it's embarrassing to attempt delivery when
|> someone else has already done so.

So have your local BBS network setup differently!

Has anyone from the ARRL field organization contacted this sysop
and asked them to fix their (clearly broken or improperly setup)
BBS software? It's a problem, the fix is trivial, FIX it, don't
complain about it !

|> 3. If someone does not check in on a regular basis and check for
|> traffic, it WILL sit and get stale.

This is a problem which MUST be addressed by the NTS organization.
Yes, I know the details. I'm talking about the ARRL field staff
here, they MUST start to make use of all resources availble to them,
or NTS will die out.

...

|> So, can present BBs software be configured to forward nts traffic

|> section level are people invited to randomly check into the nets.
|> On all other levels, folks volunteer and are assigned a given function
|> for a given time (NCS, liaison, etc.). This would have to be a
|> function that would be performed automatically once the sysop set
|> it up. The BBS sysops have enough work to do running their
|> boards as it is. If present BBS software does not support
|> such a function, what you you all think of the idea?

The software can do *anything NTS wants*.

Hoever, it just might (note heavy sarcasm) be a good idea for someone
that represents NTS (perhaps someone from ARRL?) to start a dialog
with us BBS authors. Unless we ALL know what is wanted, we will not be
able to produce anything more useful than what we have now.

To date, the ARRL has failed miserably to take a leadership position here.

|> about packet BBS forwarding of NTS traffic.

Yeah - I keep getting these "BPL" things ...
Don't care if I get one or not. Wasn't asked if I wanted any.
Was asked to provide monthly traffic summaries, and I do so.

But for heavens sake NTS - figure out a better way to give
recognition! Maybe a "KPL" for the folks that originate and deliver
via the BBS network, and a "SRC" for the sysops that provide the gear.

KPL = Keyboard Pounders League.
SRC = Sysop Recognition Certificate.

But in any case, stop trying to force fit things that were appropriate
40 or more years ago to the present reality.

|> Since it's 24 hr operation, good lightning protection is a must.

Sounds like Gary needs better BBS software, a better configuration,
or more help from his users. I find that the system takes perhaps
30 minutes per day to service ... but I get a lot of help from the
other folks that use the system - for example with new user education.

Of the average 500 messages per day, perhaps one or two need to be
readdressed by hand, others are handled automatically by the software.

Yes, one needs to keep routing tables up to date. Perhaps one minor
change per week as new local bbs systems come on air, or network links
are added or lost.

I am looking for good Packet software for the "client" side. I have an Amiga 2000 computer and have given up on finding any on it's platform. I guess most Amiga users are not interested in using their computers resources for packet.

I am tring to find a IBM PC packet program called TPK the version I heard was current was TPK-V181.zip. If you know how one can find this via FTP on the Net or are using a GOOD program for use on packet that allows the Uploading/Downloading of files, Mail services, etc. please respond to the mail address: pc-monsoorm@ccs.csus.edu.

Thanks for all the help!

I believe that you will find these signals are encrypted. They are operating
often in a synchronous rather than asynchronous mode. With out the keying
material, you don't stand much chance of reading them. NSA probably is
able to crack them. There are some Ship to Shore stations operating in
these areas in the NAVTEX (AMTOR) fec mode. Your unit will read them
nicely. There is also Ship to Shore ARQ which you can monitor..only
problem being that the freq between shore and ship are split.

Of course not. It's a "culture" problem.

> I would like to see local Amateurs volunteer to be the

And a second radio is needed for voice communications. To preserve
the culture, of course. All the NTS types could have a net at some
specified time to discuss what traffic they passed. After all, who
would want to participate in traffic handling unless their efforts
were known and appreciated by other like-minded individuals?
(Part of the Culture, you know..)

Are you using JNOS 1.10a or 1.10b ? SAM callbook support is in those.
Run the samapi program, do a start callbok in your autoexec.nos
file and set yourself up as the callserver. Then enter callbook <callsign>
or go in the mailbox and enter Q <callsign> to look up calls. The
callbook server is on tcp port 1235.

Ron N8FOW

PS: You may have to recompile the code (or get someone else to) to
have the callbook server. Normally doesn't come compiled in
the distribution .exe files.

According to Karl Medcalf at Kantronics, they are willing to license the protocol to the other manufacturerers (I am sure at a price).
I have had several conversations with AEA on this topic and their answer so is that they are investigating "alternate" protocols and will wait and see what the response is at the Dayton Hamvention to GTOR and Pactor II.

I have had a couple of GTOR qsos and it is very fast when compared to Huffman compressed Pactor. I have found it impossible so for to judge how much "better" it will be in a high QRM enviroment such as 20 meters. If first impressions are correct, we still have not found a replacement for weak signal AMTOR ARQ operation.

Message-ID: <4B04Jc4w165w@opus-ovh.spk.wa.us>
Source record: 49755

MiniSport Laptop Hacker - Vol #21. April 1994
To discourage pecuniary interests, Copyright (c) 1994 Brian Mork

>>> ADMIN
The MLHacker series is formatted to print out on 8.5"x11" sheets manually fed into an Epson LQ-850. I print at 8 lpi, which gives 82 lines per page. My goal is to make each MLHacker one to two pages, to fit front and back on one page. Back issues are available via Internet e-mail and ftp archives and direct from my data line listed below. File download privilege is given on the first call. Use the F)ile option and L)og into the \public\computer directory. No cost 'cause I just like doing it. Do something you're interested in for free and pass it on!

The Air Force has me committed to some massive amounts of overseas flights during April and May. For this reason, I expect MLHacker will take a hiatus during that time.

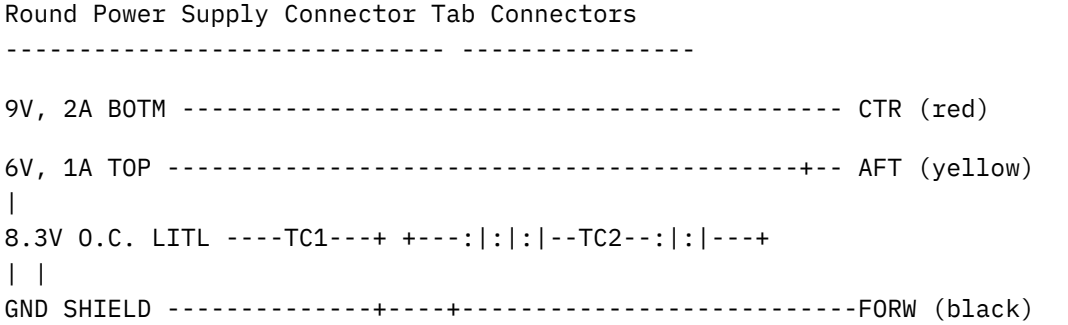
>>> AUTOMOBILE POWER SUPPLY
Something has been bothering me ever since issue #12 of MLHacker. I mentioned how you could tap into your car cigarette lighter, step the voltage down to 9 volts and use that to power your Minisport. So far, true. My bad recommendation was the placement of a noise-killing capacitor and inductor.

Yes, put a big inductor in series (old lamp ballast works fine) to kill ignition glitches. But don't put the capacitor on the car side of the inductor. Put it on the *computer* side of the inductor. The problem is this: When you switch off the computer, the magnetic field sustained by the inductor collapses, forcing continued current flow. But the computer is off! Being off is a high resistance. As the charge collects on this high resistance, the voltage peaks very high. To some extent, the internal Minisport battery, which is effectively in parallel across the power line, begins to conduct (i.e. charge up) as the voltage rises, so there is some limit on the voltage. But I was wrong to suggest putting the capacitor where the inductor could feed off from it. It's much better to put it on the computer side, where it will dampen the inbound current. An additional improvement would be to put a diode across the inductor (cathode, banded end toward the car). It will then short out the inductor spike upon power-down.

Some folks have indicated they run the Minisport straight from 12 volts. I'm not sure I'd recommend that, but I'd be interested in anybody's success doing this. Battery? Direct from car? One MLH reader is working to modify a drill battery pack to power his Minisport. I hope to talk him into writing up notes on the project.

>>> INSIDE THE BATTERY PACK
Jim sent me a dead battery pack to rip apart. Aha! The final link to the puzzle. MLH #12 discusses the wall adapter/battery pack connection. MLH #14 discusses the battery pack/computer connection. Issues #17 and #18 discuss the switching power supply board inside the Minisport. Finally, here's the stuff from inside the battery pack. In the process of documenting this, I discovered another error from issue #12--my description of the small pin on the 3-pin charging connector. I believe the information provided here to be the correct interpretation.

BATTERY PACK INTERNALS



There is also a tiny chip capacitor between the 9V supply rail and ground. A parallel surface mount spot (for a resistor?) is empty on the circuit board inside the one battery pack I've inspected.

The charger adapter has four connections: the shield, two similar pins, and a third pin smaller than the other two, thus the titles BOTM, TOP, and LITL. The tab connections on the bottom of the battery pack correspond to the three slide connectors visible inside the minisport when you remove the battery pack. The colors correspond to the wiring color visible inside the computer when the bottom is removed.

TC1 is a thermal cutoff unit, tightly mounted to the battery cell closest to ground. TC2 appears physically similar. While charging this battery pack, I monitored the voltages on the power supply connector. BOTM was 9.2V, TOP was 7.6V, and LITL was zero volts. I applied a heat gun onto TC1, and at 0:12 the voltage at LITL jumped up to 8.3 volts. At 0:40, TC1 closed and the voltage at LITL went back to 0 volts.

It seems clear that the design of this system is to overvoltage the batteries (7.2v onto a 5x1.2 => 6.0v battery pack) and when the batteries get warm, the thermal cutoff ungrounds a signal back to the charging unit. To confirm that the charger responds to the signal, I loaded the battery pack with a 20 ohm resistor and hooked up the charger, giving 7.2 volts across the resistor (about 350 mA drain, 2.5 watts). I would expect that if the charger shut off, the voltage would drop a little bit as the battery pack picked up the entire load and started discharging. Sure enough, after about 20 seconds of heating TC1, the voltage across the resistor dropped to 6.8 volts.

Heating TC2 has expected results. While charging, I measured 7.0 volts across an unloaded, charging battery. At 0:20 of heating, an audible

click occurred and the voltage dropped to 2.9 volts. I turned off the heat gun and at 1:14, I heard another click and the voltage comes back up. While *not* charging, the voltage goes from 6.5 to 0.0 with nearly identical timing. I think the 2.9 volts observed while charging was residual output from the charging unit.

>>> BAYCOM VS POOR MAN'S PACKET
Poor Man's Packet software works fine to receive packets on the Minisport using the hardware described back in MLHacker #9. It does not work on transmit. If you try to send a packet, the transmit tones just lock up at 1200 Hz or 2200 Hz. This was confirmed using another ham's (thanks Ron) PMP hardware rigged to run off COM1 (normal DB-9 out the back). PMP is written in C, including the AX.25 bit packing routines. I think these are just not fast enough when run on the 8 MHz Minisport.

Baycom uses a separately loaded driver to talk to the hardware. It's small and efficient, probably written in assembly. I got a copy of Baycom software and using Ron's Baycom hardware, which was rigged to operate on a parallel port, everything worked fine.

Conclusion? The Minisport needs bit packing routines written in assembly. Baycom offers this; PMP does not. I thought the PMP hardware was designed to be bit compatible with Baycom (e.g. RTS does the PTT function, and so on). Apparently, this is not so. When I redirect the Baycom to COM2, it does not work with the PMP hardware I built and described in MLHacker #9.

I don't have the time right now to do an assembly rewrite of the PMP software, so I want to figure out how to use the Baycom software. Anybody out there more familiar with Baycom and what bit lines it uses for what? Eventually I'll poke around and find out what's going on, but maybe somebody could save me the trouble.

>>> FUTURE PROJECTS
I saved up money for several months and purchased a Fluke 97 digital storage scope / DMM "do everything" box. It's roll mode data monitor worked great for probing the battery pack. Expensive, but a *superior* bench top accessory. I'm interested in anybody using one of these. Mine has an optical data interface and that will, I'm sure, eventually be hooked to my Minisport.

I also picked up a 670 nm laser diode assembly, including a photodetector and stepper motor. The light beam comes up through the shaft of the stepper motor, allowing the outbound beam to be aimed onto one of eight mirrored segments, and reflected forward. Inbound light is collected by all eight segments simultaneously and focused onto the on-axis photodetector. I wonder if I can hook this up to the computer to do a laser light show. Or maybe a proof of concept optical radar. Hmm... :-)

864. TCP/IP <--> FBB ax.25 link

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-04-01 19:13:03 UTC
From: HOSPICE@rivendell.otago.ac.NZ
Message-ID: <01HAOY3WODEAP1KTAW@rivendell.otago.ac.nz>
Source record: 49756

Re: Subject: TCP/IP-f6fbb (ax25) link, how do you do it ?

Daniel writes:

>Would anybody know how to manage forward between a tcp/ip STATION
>and a f6fbb BBS without being declared as a BBS (eg, when you send out
>to the f6fbb BBS the command sp xxxxx < hb9vbc @ hb9vbc, it immediately
>advises the sysop and tells you that they don't forward to hb9vbc bbs!)
>Where does this have to be fixed ?

Sending SP ZL4ABC < ZL4DEF @ ZL4GHI to an FBB BBS results in an msg labelled
like this:

```
Message Choice - [*]
Msg # TSL Size To @BBS From Date/Time Subject
------ --- ---- ------ ------ ------ ----------- ----------------------
25493 PNL 0 ZL4ABC@ZL4GHI ZL4DEF 940401/00:58 TEST
```

As you have discovered, unless the FBB has a forwarding path set for the
@BBS, then it goes nowhere and the sysop gets a msg.

Posting the same SP on a JNOS station produces a msg for ZL4ABC on that
JNOS station, with the msg being labelled as coming from ZL4DEF@ZL4GHI.

If you could state your intent in posting that address format to an FBB, more
useful help may be possible.

: Dean

I used XR2206 and XR2211 for RTTY modulator and demodulator
application.
I also used MC14046B for the modulator part(XR2206), too.
You may use MC14046B or 4046B for that function generator
purpose

Cross-posted to: comp.archives.msdos.announce,rec.radio.info,rec.radio.amateur.digital.misc

I have uploaded to the SimTel Software Repository (available by anonymous ftp from the primary mirror site OAK.Oakland.Edu and its mirrors):

pub/msdos/packet/
aprs403b.zip Updated files for APRS Packet Reporting System
aprs403x.zip Hams: Automatic Packet Reporting System (APRS)

Aprs403b.zip is the latest version (as of 25 March 94) of APRS, and includes only the bare minimum of files, plus an updated .map file. Aprs403x.zip contains all the other files required for a complete package, plus all supplemental files normally included in xtrannn.zip. If you have an earlier version of aprs403.zip, aprs403b.zip is all you need. Both files are needed for the full package.

Changes since version 400 include a fix for AEA TNCs, ability to interface GPS and TNC with only one serial port, and a few minor bug fixes.

APRS avoids the complexity and limitations of trying to maintain a connected packet radio network. It accomplishes the real-time display of operational traffic via UI frame broadcasts and map displays. A station with information to contribute transmits it, and all stations receive it.

Isn't this a modem chip? I think EXAR is alive and well. My
dual 16C550 chip on my PC's i/o board has an EXAR label.

872. Anyone using AmigaNOS??

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-04-02 19:55:09 UTC
From: hardie@herald.usask.ca
Message-ID: <2nkiit$lce@tribune.usask.ca>
Source record: 49767

Is anyone out there successfully using AmigaNOS? I'm having trouble getting it to do some things that I thought would be relatively easy.
First, I am using V2.9n and I have 2 TNCs so I can run two separate copies of AmigaNOS on my A3000. One copy uses my VE5VA call and the other is set up to use my other call VE5ESE. I set both copies up to fire up netrom but if I try a "netrom connect" from one to the other the attempt times out and fails, even though I can see in the trace window that the receiving end is giving a response of some sort (an RR).
Any ideas why my netrom won't respond? It also will not respond if I only fire up one AmigaNOS and use the other TNC as a normal AX25 and try to connect to the netrom that way. Furthermore, the route updates are going out and are accepted by our local netrom node but if I do an AX25 connect to that and then try a connect from there back to my netrom it still times out.

The other problem is that I can't get one of the AmigaNOS copies to act as a domain server for the other. If VE5VA has all the local IP addresses/names in its domain.txt file and VE5ESE sets up a "domain addserver" to point at ve5va, then if ve5ese tries to get domain info from ve5va (e.g. asks for ve5dsc.ampr.org) then ve5va will respond with a message which in the trace window shows that its ICMP field says node Unreachable code Port.
ve5dsc is definitely in the domain.txt file. Are there other commands (e.g. arp) that need to be set up to make ve5va act as a domain name server?

Finally, is there an Email reflector for AmigaNOS? I'm on the nos-bbs reflector but I think some of my questions are specific to AmigaNOS rather than JNOS.

You could also try changing the clock speed on the machine; most just have
an CTRL-ALT-+ and CTRL-ALT-- type of thing to do it. Mine does, and it also
has a jumper to make a change in speed more permanent; if you have a 50mhz
386, and you are working 50 mhz range, that won't wokr obviously 8-).
On mine, I can just tune an indoor radio up the dial and there are really
loud harmonics (prolly not helped by the fact it isn't in a case yet 8-)
That reminds me of the other thing; Check the case. You can get a new
one, or just make sure the expansion bay slots are all covered; those suckers
are basically fancy radio antennas straight off of the computer bus.
Hope it helps.

I'm too cheap (well, perhaps, "too cheap" is not an operative phrase in ham lingo) to buy a book with a description of AX.25. Besides I'm a regulation kinda guy, and I would like to have a look at the official...(drum roll, please)...

"American Radio Relay League, Inc., AX. 25 Amateur Packet-Radio Link-Layer Protocol, Version 2.0, October 1984 (or compatible),"

as quoted from my FTP'ed version of Part 97. I am assuming, of course, that my copy of Part 97 is citing the most recent revision of AX.25.

At any rate, is it around?

thanks

jb

883. Re: AEA & Kantronics TNCs

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-04-04 03:39:47 UTC
From: wb6w@netcom.com
Message-ID: <wb6wCnpu6B.KxM@netcom.com>
Source record: 49778

If you choose to get the MFJ 1270, get a real 1270 (older version) and NOT the 1270A or 1270B. The critical difference is if the MFJ TNC in question has a switch of some sort to change between HF/FSK and VHF/AFSK operation.

I have a 1270 and also a 1270B. The 1270 has been an excellent TNC while the 1270B NEVER functioned correctly in a VHF/AFSK environment. The main difference (as far as I can see) is that the 1270 has real filters (switch capacitor) in the audio front end at the mark & space freqs while the 1270B replaces it with a very simple RC filter. The simple RC filter is much easier to switch between VHF and HF operation but is at the same time far less effective as a filter. The 1270 is more difficult to switch between VHF and HF (MFJ claims it can be done), but who wants to run HF packet when there are much more robust modes available? By the by, both the 1270 and 1270B are based on the TAPR TNC II design and should be firmware compatable.

Oh, what did I do with my junk 1270B? I installed a 9600 baud modem, thus bypassing the crummy Mighty Fine Junk kludge. The TNC hardware now works just fine in KISS mode. I did have to trash the MFJ firmware because the automatic powerup reset that it does every few minutes in KISS mode goofed up the TNC parameters I set. MFJ did (when asked) provide a way to shut off this autorest facility, however their fix only increased the length of time between resets from minutes to tens of minutes. I've since replace the firmware with KISS-only firmware and have had no problems since.

You might well consider the KPC-3 as an alternetive. It is true that is uses a proprietary archetecture and that other TNC firmware (NetRom et al) won't run on it. It also is incapable of 9600 baud operation. On the other hand, if you don't want to do these things and are interested in pure 1200 baud VHF/AFSK, the KPC-3 is difficult to beat. The internal mailbox is much more user friendly than the MFJ version. The KPC-3 also provides KA-node facilities that are very useful if that's your bag. My KPC-3 has been in operation in KISS mode (continuously) for the last year or so. It has been flawless in performance (outside of cockpit trouble, that is!).

>firmware compatable.

MFJ was acting based on the advice and experience of TNC 2 users when
they removed the MF10 filter section. Many of us discovered that the
tone twist introduced by the MF10 caused failures to correctly demodulate
packets. The TAPR suggested cure was to remove the MF10 and jumper it
out with a capacitor/resistor combination. Since that worked much better
in practice, MFJ started building their TNCs that way from the factory.

Since VHF/UHF packet links are rarely noisy, no audio filtering is
required in the TNC, and the tone twist introduced by the MF10 was
often very detrimental. It may be that the particular radio you were
using with the 1270B had tone twist of its own that was complemented
by the MF10 in the original 1270. If you connect directly to the
discriminator, you should get flat tones out for the TNC and it'll
be much happier.

>John K3KXJ

I have also run into these signals. I always thought the inability
to decode them was due to shortcomings in hardware interface and
software. (I use Hamcom 2.2 with the 741 op-amp interface.) But
this may not be the case.

After receiving the last half of a weather-fax map, the station switched
to RTTY. It was strong signal, and the weather-fax came in OK. After
it switched to RTTY I fired up Hamcom 2.2. It was easy to figure out
frequency shift and baud rate with the "Spectrum" and "Bit length"
screens. But the text was undeciperable gobbledygook.

Seems like it must be some type of maritime-related station. Anybody
have more specific info?

|> a rash of multiple NTS deliveries.

This is a very serious problem.

There are many possible causes, but they all come down to poor operating
practices by the sysops. If the sysops had things set up reasonably,
and made certain their systems were operating properly, then there would
be no (zero, zilch, none) duplicated bulletins.

Personal messages and NTS traffic are handled differently.
Duplicates are allowed to occur, rather than lose an occasional message.
However, these duplicates should be rare: 1 in 1000 perhaps.

Sounds like the sysops involved have not done a very good job of
getting their systems to work.

You can't just "Load the BBS software and away you go."
It takes thought, planning, cooperation, and coordination to make a network
work properly. In the past couple years, I have noticed a distinct lack of
all of the above in many parts of the BBS network.

Perhaps time for some organization to take a leadership postion here?

(ARRL, where are you when you are needed?)

Would you explain please?
Why would not *not* register all addresses within your domain?
How else will addresses become known?
How else will coordination take place.

What "left to right parsing"? You clearly have no clue on this topic.

What "top level designator that was already used ..."?
Can you explain what you are hinting at here? The "NA" domain:

1. Did not exist when packet BBS domain names were chosen.

2. Is not a top level domain the the packet BBS network.

|> Let's face it, namespaces (like routes) are always leaky in practice -
|> if you choose to ignore that fact during the design phase, I fail
|> to see how shifting the blame to the users helps.

Excuse me?

You are perhaps talking about the internet, which chose to ignore
the existing use of NA in one of it's connected networks?

Or do you mean the stupidity of *not* registering the packet BBS domains?

Who should register them? Why have they not done so?

There has recently been a lot of local interest in NTS, I just started running the packet bbs for the area.....and I'd like to know how I get setup to handle NTS.

Is there any coordination of NTS? What postal codes do I have to handle, how do I set it up, and how do I route outgoing stuff, etc.

Our club is scrambling to set up a radio station at the new local Red Cross building....it would be nice to have it operational before the Red Cross conducts their simulated emergency next month....should be fun. We are setting up HF, VHF voice and VHF packet....and CB with the local REACT people.

|> as yet it doesn't. And yes, go ahead and lay blame on the
|> users for not promulgating requirements. I'll concede that one.

And why should things be different now?

Service messages *can* and often *are* automatically generated.

(My system does *not* generate them automatically, I do this personally.)

If NTS choses to assign liason to the BBS network, things will
work just fine, as demonstrated in many parts of the country.
If NTS choses to "just let things happen any old way" then things
will not work. An un-organized network will indeed fail, as has
happened with NTS use of the packet network.

Why has the ARRL chosen to avoid a leadership position here?

|> Again, it's the concept of a continuous network of operators, versus
|> a bunch of far-flung independent bbs users. Perhaps we don't need

|> Would TPEUG survive, or become just another boring techno-concept.
|> Really, I don't claim to know.
|> (I hesitate to bring up a dirty word in this enlightened environment,
|> but where is the camaraderie?)

And how is "TPEUG" any different than NTS?
I read what you wrote above, and see exactly the same operation.
Hams using radios to move messages for third parties.
Why would NTS create a "... group of far-flung independent..."?
Seems to me that is what NTS is right now ...

|> In the spirit of constructive amateur radio dialogue....

Sorry you didn't like my midwest directness ...

Will restate my main thesis: The ARRL has failed to take a leadership
postion in a rapidly growing portion of the hobby. Due to that lack of
leadership, the NTS system has failed to make use of a valuable resource
now available to it. I have personally spent as much time and energy as I'm
willing to spend attempting to convince the ARRL leadership to take action.

My question to the net is: if the ARRL will not take a leadership position,
then which organization might?

What we have today in the BBS network is near chaos. Early in the
development of the network things were much simpler. A few people made the
decisions, the others followed, and we built an intitial network. The
initial work was successful; we now have a widespread network, with a large
number of users. We do not, however, have *any* form of organization
within that network. The ARRL *could* take a leaderhip position, and help
to organize, set standards, and discover best operating practices. They
have not done this.

895. bbs versus NTS ?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-04-04 19:10:59 UTC
From: ostroy@cbnewsh.cb.att.com
Message-ID: <Cnr1AE.4pI@cbnewsh.cb.att.com>
Source record: 49703

Although I thank them for responding to my posts about NTS,
I'm beginning to think that there is a language barrier between
bbs sysops and the rest of hamdom. (how do you draw a partial smiley?)

jangus@skyld.grendel.com (Jeffrey D. Angus) wrote:

> It certianlly isn't the fault of the
>BBS system that messages are forwarded in good faith only to be ignored
>once they reach their destination.

Not once did me or anyone question the ability of the message to get
to the destination bbs "most of the time". We concede these truths.
Thou doth protest too much.

>Adding another layer of management at NTS is not going to solve the problem.
>Getting NTS to realize that the packet system is there and that it indeed
>does work is the key. EDUCATION. Plain and simple. The ARRL should get with
>the program and educate people rather than ignore it and hope things will
>somehow magically return to how they were in the 40's.

I don't think that NTS can wholly evolve into a bbs-oriented activity
any more than a boat can change into an airplane. People who
enjoy boating will continue to enjoy boating, no matter how many
times you tell them that airplanes are faster. Same with NTS
versus packet/digital modes. Yet both boats and planes have a
legitimate role in public transportation, and so too do all the
different forms of 3rd party message modes, both old and new,
at least for now.

>I run a BBS and I deliver the traffic that is sent here (unless one of my
>buddies beats me to it). Rather than carp about the shortcomings and try
>to point the finger at others, I do the best I can to see that it all works.

Great! Hey, I'm not anti-bbs, far from it. The bbs network seems to
do a reasonable job of getting 3rd party messages to a point near their
destination, even if 3rd party messages are such a tiny percentage
of the total.

Why do you deliver the NTS traffic that reaches your bbs ? Are you
doing it as an NTS liaison, or just because it was there and you felt
like being a good guy that day. If the latter, then why do we need
an NTS or ARRL for this function at all. Shouldn't every bbs user
be doing what you are doing? Ideally, all messages, including
3rd party, would be picked up by enthusiastic bbs users for the
joy of serving the public and NTS would be unneeded.

> The real advantage to the BBS network is that
>it can deal with thousands of messages at the same time while delivering
>the NTS messages.

Those NTS messages generally can't get delivered unless someone
takes them off your bbs and telephones the 3rd party via landline.
Some days you may do it.... some days I may do it.
You may do it as a minor aberration to your normal sysop activity.
I may do it as a minor aberration to my NTS activity.
Point is: It takes someone who WANTS to do it to make it happen.

At the present time, it would appear that the majority of people
who are interested in 3rd party messaging are predominately also
interested in the traditional modes. There are two simple ways
to change this : get the traffickers interested in digital
modes, or get the bbs users interested in traffic handling.
I really don't know which is tougher.
Carping and complaining about NTS and ARRL is the same as
complaining about all the boaters for not using airplanes.

Eventually, the old modes of NTS may die out as viable means
of traffic delivery, just as canal barges ceased being used for
freight transport.

899. CDE antenna rotor

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-04-04 21:20:57 UTC
From: nat@kpc.com
Message-ID: <1994Apr4.212057.12828@kpc.com>
Source record: 49693

Hi,
I bought a CDE antenna rotor at a hamfest last year. The rotor is
fine but the controller seems to be flaky when I try to point the antenna
between N and West. Here are the details from the back of the controller.

Model AR-33 115 V.A.C
60 cycle 1 Amp
Mfd by
Cornell-Dubilier
Electronics Div.
Federal Pacific Electric Co.
Fuquay-Varina, North Carolina.
Patent No. 3.043,998

Series 1820.

The terminal strip has 5 wires. If anybody has a copy of the schematics
of the controller I'd like to get a copy of it. Could some knowledgeable soul
explain how the 5 wire system works. I opened the controller and the
position dial is nice wire wound resistor of 1K ohm resistance which has
been hooked up as a variable resistor and not a potential devider. There is
a large capacitor across terminal 1 and 5. There is a transfromer with a
center tapped secondary. The outer terminals are connected to terminals 2 and 4.
Voltage between one of the outer terminals and the center tap is 14.2 volts.
The center tap is connected to a ground trace on the circuit board.

Is the controller setup as a bridge where the dial in the controller
is one of the arms and a similar dial up in the rotor is the other arm.
The rotor stops moving when the 2 arms get balanced. Any information will be
of great help

Sincerely
Nat.

This raises some alarm bells with me. Networks need to either send or not
send messages. Protocols are designed to be able to be sure of such things.
Could you imagine if something like an international money transfer were
occasionally duplicated on the commercial networks? It sounds like the
protocols involved (in nthis case, the handling methods) may need some
review.

Why is the software designed to allow even an occasional duplicate? Why
is there otherwise the possibility of a lost message?

Well, I am the local ARRL person (Section Manager). I'm gathering information
so that I can intelligently address the appropriate people about the

problem.

In this area the North East Digital Association runs the AX.25 net, so it would seem to make sense that they are the ones to take the leadership position on this. Perhaps I need to appoint an Assistant Section Manager who can oversee packet operations, or something like that...

Source record: 49695

All I can say is I'm glad no one is charged with maintaining the ionosphere. Just imagine the bitching out they'd get.

I do have one positive contribution to make. If duplicate messages are really a big problem, then each (or each destination) node could keep a hash code of the content of every message that has been seen in the past N days. If any hash code matches, delete the message without passing it along or making it available for download. Ignoring headers allows messages that have taken different routes to still be zapped. Using a good hash and enough bits and enough days history you could select the probability of erroneously dropping a non-duplicate to less than the probability of an NTS operator accepting a message yet dying before he delivers it.

Say 12 bits for date received (would allow over 10 years of data to accumulate and still allow for deleting by day, talk about overkill) and 52 bits of hash for a total of 8 bytes retained per message. If 100 messages arrived daily, and we kept 120 days worth, we would be keeping 96K bytes of data, not even a floppy disk worth. There would be 12,000 hash patterns (no duplicates) from a data space of 2^52, giving the possibility of erroneously deleting a random incoming message of 0.000000000266 percent. Add a few more bits to the hash code if that's not good enough for you. Even as it is, at 100 messages daily, it means only one dropped message every 10 million years on average. I don't think this will be the weak link in delivering messages.

Of course, I don't claim to be a mathematician or statistician, so the above numbers should be taken as a general approximation at best. Still, it's one avenue open for exploration.

Oh jeez, Hank, stop making things up. The AMPR.ORG domain has never used
the ham bbs hierarchical routing/addressing scheme to name hosts.

With some exceptions, the namespace of the AMPR.ORG domain consists
solely of callsigns within the domain. Names are not routes, routes
are not names, and mixing them up is one of the worst possible mistakes
a network architect could make.

That means that whilst you might see
W0RLI.AMPR.ORG
or
BBS.W0RLI.AMPR.ORG
you won't see
W0RLI.#NNJ.NJ.USA.NOAM.AMPR.ORG
or the like

Ever.

905. Baycom modem and AMTOR?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-04-05 08:52:58 UTC
From: "Andrei P.Petrov" <pap@pltx.nov.su>
Message-ID: <ABgRIejupL@pltx.nov.su>
Source record: 49699

Does anyone have the info about the possibility to
operate AMTOR with a simple modem in "Baycom" style.
Here is home made modem based on TCM3105 with an
external modulator (for 300 baud) on 2 IC's and an
active filters on 386/7 dx 40mHz at clone.
It's working well PR with software Baycom V1.5
and RTTY with Hamcomm V2.1, but i am still looking
for any other software, which allow to operate with a
"normal" terminal program, such a SP,GP... or in any
other mode (AMTOR, PACTOR)
I can't find this info here on local VHF BBS,
because the nearest one located abt 200 km from here.
So it is only one way to find it - this place.

Thank's
Andrey Petrov, UA1TFA.

Hmm, I'm running 2.9l, I couldn't get any of the newer versions to run without
crashing.

I found that I couldn't get it work with any other serial port, other than the
internal one. Telling it open unit 2-8 (A2232) it would write out of the port
correctly, but the receive activity came from the internal....and having two
different things reading from the same port (it didn't matter if they were both
the same program), would lock my machine eventually. So, I could only run one
port. The same problem happened when I was running AmiPAC....I didn't try
any newer version of AmigaNOS.....come to think after I figured out that
AmigaNOS had to be on the internal...I didn't try much else with more TNCs...
actually I want to SLIP link to my UNIX box (at work). Even though I moved on
to run CBBS....and now I'm not running anything on the Amiga.....since I got
the PC and run FBB/BPQ/JNOS (I'm trying to get JNOS to be stable, then I'll
try linking the Amiga in again).

>

This is the third try.

Thus far, the responses have only been "The way it is done now is wrong."
This is from at least three avowed "networking experts."

However, "It is wrong" is useless information.
We all perfectly willing to agree that it is wrong.

I have been attempting to get answers to a different question, let me try it again.

"What should we do so it is done right?"

So far, nobody has posted any useful response to this question.

Can you explain what you meant by "... ad hoc network..." and give examples
of "non-ad hoc networks"? This might be helpful information.

Long ago and far away (when this packet stuff all started) several of us
asked the same question, and go much the same answers we are getting now:
"No No No, you are DOING IT ALL WRONG". We got tired of this and simply
went ahead and defined our own subdomains of ampr.org.

Again, we have the same response from the "networking gurus", but a total
lack of useful information.

If indeed "we got it all wrong", what should we do to fix that?

Waiting with 'bated breath for an educational reply ...

... Hank

>delivers it.

This would all be fine, IF the NTS messages passing through the BBS systems travelled the same route all the time, and could not be picked up (the word "rescued" sometimes applies) from intermediate nodes. In my section, it is possible for traffic coming from west to east, for example, to get stuck somewhere, and someone in the NTS community will pick it up before it becomes too stale. Why did it become stuck? Some BBS to BBS link died, for example. Adding duplication to that, one copy of the message makes it through, the next one gets stuck and someone picks it up, and forwards it over voice.

There is NOT a 1 to 1 mapping of destination towns and NTS people. I deliver for a bunch of towns that overlap with several other people. We do not all have the same set of towns, nor the same schedules. I do not do traffic handling every day, nor do most others.

With traditional NTS handling, there is the positive confirmation that the handling happened and will happen. Perhaps BBS-based NTS traffic should be handled with HX codes indicating report of all hops, and perhaps the BBS's should be asked to turn that on. It would generate a lot of traffic, though. I would like some sort of confirmation of delivery of any NTS traffic sent through the BBS system, along with the callsign of the person who picked up the traffic (killed the message). If that could be implemented as return personal mail (or traffic) that would be VERY helpful. I'd like to see the same functionality for personal messages as well, come to think about it!

Is that doable, Hank?

Keywords: teletype RTTY digital signal identification

In regards to the questions on RTTY signals on the SW bands:
There are hundreds of different FSK modes in use by government and
commercial HF stations worldwide. 95% of these are encrypted so that
they cannot be decoded without the proper key (usually some form of bit
inversion). In addition to the coded signals, there are also stations
using odd speeds and shifts and stations transmitting non-roman text,
ie, chinese, korean, etc. If you are interested in decoding some of these
transmissions, Universal Radio makes several high end digital decoders
which can probably decode a large percentage of what is out there.

Yes there is a mod required to use the C version of the tnc with TheNet or
X1J. Here's a copy of the message that went around about it.

Bill N8KHN
healy@moriah.ee.unr.edu

X1/TheNET mods for MFJ-1270C

From: WB0YRQ@NF0N.#NENE.NE.USA.NA
To : INFO@ALLUS

WB0YRQ @ NF0N.#nene.ne.usa.na /TPK 1.81 Msg #:751 Date:02-01-80
Time:9:56Z

To modify the MFJ-1270C for use with X1J/Thenet EPROMS follow
these instructions:

You must complete all of these steps in order for Netrom firmware
to function.

NOTE: if you are not using X1J firmware skip the first step and make
sure that JP15 is set for 256k.

Step 1: Bend pin 1 of 27c512 out so it will not touch socket, then
jumper pin 1 of 27c512 to pin 8 of MODEM header J4. (see X1J docs)

Step 2: Remove U40. Add jumper from pin 16 to pin 1 (ground pin 16)
^
[I think this should be 10 (gnd)]

Step 3: Remove JMP9 altogether (no jumper on any pins)

Step 4: Cut JMPX "PAD" to prevent node from hearing itself

Step 5: Add 100ohm resistors to R14 and R15 if not already in place.

This information came directly from MFJ and I have used it successfully.
Hope this helps you.

Isn't this kind of like someone listening in to a HF pass between two
other operators and then deciding to deliver that traffic themselves?

I'm not a NTS or BBS manager (I rarely use packet at all,) but from
the outside it looks very much like the NTS has not yet figured out
how to use the pipe being offered. I'm sure it is more complicated than
that (hi hi) but simply designating which zip codes can be taken off of
which BBS systems would eliminate the above situation. The "rescuing"
is *causing* part of the problem.

Yes, a standard addressing scheme needs to be developed (and enforced,
no fair having sysops do a bunch of manual corrections for people.)
With a standard header scheme, the intermediate nodes could hide
data, removing this temptation.

Finally, an auto-reply mechanism which returns a message that the traffic
has been picked up at the far end (and by who) would allow the tradition
of 'forward or deliver' to be passed on in the packet world. If the
originating station has not received a reply within a pre-determined
time (probably should be coded within the original message), an
alternative method of delivery should be chosen. I'm not sure that
this would not cause more problems of duplicated messages than the
existing ones though.

Oops, I see you have covered this last point below.

>I would like some sort of confirmation of delivery of any NTS traffic sent
>through the BBS system, along with the callsign of the person who picked
>up the traffic (killed the message). If that could be implemented as return
>personal mail (or traffic) that would be VERY helpful. I'd like to see the

Well, I have stuck my neck out way too far on something I have only a
vague concept of. I do think the auto-kill by hash code is immediately
implementable without having to deal with any of the other issues yet.

913. GTOR INFO

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-04-05 23:28:47 UTC
From: BJARTS@stthomas.EDU
Message-ID: <01HATOE2L7VM91WF9U@stthomas.edu>
Source record: 49708

THE FOLLOWING TEXT WAS PICKED UP FROM THE DL2FAK PACTOR MBX IN GERMANY
BY VE2FK IN MONTREAL. IT WAS WRITTEN BY DL2FAK, ONE OF THE DEVELOPERS
OF PACTOR.

G-TOR - An Improvement?

G-TOR is a new digital mode, which has been developed by Kantronics. Most of its features (like on-line Huffman data compression, link-quality based baud rate adjustment, CRC, fundamentals of the packet structure, etc.) are adopted from PACTOR. The baud rate used in G-TOR can be 100, 200 or 300 baud. The main differences are the use of Golay forward error correction coding with the obligatory data interleaving and a hybrid ARQ system.

The Golay encoding however, as used in the G-TOR mode, is only able to correct 3 bits in a block of 24 bits and only half of this block (12 bits) carries information. The remaining 12 bits have to contain the required redundancy, and no new data. It is therefore only possible to correct a few errors despite the large overhead. For this reason the Golay encoding would only be useful for errors caused by short spikes on the higher short wave frequencies (10 to 20m). You cannot however expect it to provide any improvements in typical 80m conditions. Here it is necessary not only to use hybrid-2 ARQ systems, but also suitable, powerful (invertible) codes, which allow the reconstruction of the original information, even when only the redundancy block is received, rather than Golay or similar simple block coding, which always requires both blocks to be received to get the data transferred.

The most robust HF (short wave), narrow band, data transmission systems known, apply very powerful convolutional codes with Viterbi decoding and soft decision (requiring an ADC/DSP just like analog Memory-ARQ). The processing speed of those systems exceeds the capability of a KAM by factor 100. Despite this very expensive approach, they only achieve around 10 dB better weak signal performance than PACTOR-1. The closer a system approaches the Shannon boundary (theoretical throughput limit) the more difficult it gets to gain another one or two decibels.

W0XI et al claim that they were able to transfer a certain file on the 20m band in about 5 minutes using G-TOR, whereas PACTOR, which was used afterwards, took about 20 minutes. The conclusion was that G-TOR would be about 4 times faster than PACTOR in general, which is actually impossible!! According to the system description, G-TOR can on average only be about 1.5 times faster than PACTOR.

The 20m band, which was used for the tests, normally provides a good SNR and only very few fluctuations. It is therefore obviously no problem to reach higher throughputs, especially when using 300 baud (even short wave Packet Radio could have been faster than PACTOR in this case). Also, the comparison

between PACTOR and G-TOR was based on the PACTOR implementation in the KAM, which does not, apparently, provide the full performance anyway, due to the different converter and the missing ADC. Since the KAM already uses a modem designed for 300 baud operation, it is obvious that G-TOR is favoured. The original PACTOR system will still do better than G-TOR on weak signals, as an ADC is used in the PACTOR-Controller (PTC) to allow real analog Memory-ARQ. To achieve impartial results, you have to transfer the same files containing random characters on the typical 80m conditions in G-TOR using two KAMs and in PACTOR using two PTCs. The 8.64 characters per second, considered to be the typical average throughput of PACTOR, and which led to the conclusion that G-TOR would be 4 times faster than PACTOR, are much slower than the average rate we obtained with our units. Under even worse conditions we obtained around 17 characters per second, depending on the transferred information due to the Huffman coding.

Regardless of the Huffman data compression, which improves the throughput of both systems in the same way, the comparison of throughput between PACTOR and G-TOR can be easily calculated. According to the protocol description published by W0XI, G-TOR is able to transfer a maximum of 19 characters per second when running on 200 baud (They claim 69 data bytes in a cycle duration of 2.4 seconds at 300 baud, which means maximum 2/3*69/2.4 characters per second at 200 baud). The maximum rate of PACTOR at the same speed is 16 chrs/s, which is a relationship of 1.18 to 1. The Golay encoding is not able to improve the throughput so dramatically that you finally result in a factor 4. It must be remembered that the analog Memory-ARQ, as used in the original PACTOR implementation, is able to improve the effective signal-noise ratio with each aggregated packet and hence enables a higher throughput (especially in weak conditions) than the Golay coding gain. It is therefore obvious that the higher maximum throughput of G-TOR is mainly based on its higher maximum baudrate. This however means, it has to exceed the usual 500 Hz band width limit.

With this in mind it must also be remembered that a wider receiver bandwidth receives more noise. A 300 baud G-TOR signal will therefore have a poorer S/N ratio than a 200 baud PACTOR signal (if they are both of the same fieldstrength and the receiver bandwidth is correctly adjusted for both modes). As signals decrease, G-TOR would have to switch to 200 baud before the PACTOR signal would be affected, thus further reducing some of the proposed speed gain.

There are still some more disadvantages of G-TOR in comparison to PACTOR, e.g. the cycle duration is quite long at 2.4 seconds, and will increase to almost 5 seconds when using the Golay encoding, hence leading to quite long break-in times. The speed adaptation times are necessarily also longer, thus leading to poorer results in rapidly changing conditions (multipath).

Furthermore, the interleaving and the 3 different baud rates used in G-TOR will probably lead to a lot of problems with the listen mode, an important point for all digital modes used in Amateur Radio.

Actually G-TOR is just a modified PACTOR system, which probably does not provide enough improvement that introducing this mode as another new standard would be worth-while. With regard to the basic requirements of each digital data transfer mode (like throughput, bandwidth, error rate, etc.) PACTOR al-

ready represents nearly the optimum attributes that are obtainable with an FSK system. A real improvement over the current PACTOR system can only be reached when using different modulation schemes like PSK, which require a DSP hardware.

This step will be done this year with the introduction of PACTOR Level-II.

We are not talking "banking networks" here, we are talking about a network
rather similar to the internet. Duplicates occur. Such is life.
Any suggestions you have would be most welcome ...

|> Why is the software designed to allow even an occasional duplicate? Why
|> is there otherwise the possibility of a lost message?

What would prevent duplicates or lost messages?
How would you accomplish this? Remember we don't have a "fixed
configuration" network. We don't have reliable paths. We do have multiple
ways to get from point A to point B. We don't have a protocol that
addresses all the problems, and would *love* to have one.

Any suggestions would be most welcome.

I hope we will hear from the networking gurus on these topics.

So far, we have heard from a couple of the networking gurus.
Their message has been "You are doing it wrong."
I presume they will follow up with "And here is how to do it right."

("just use tcp/ip" is not a reasonable answer. We don't use it.)

...

>is *causing* part of the problem.

Actually, the need for rescuing is a BIG problem, and indicates a failure in the network. At least SOME of the BBS systems show the NTS traffic as listable on EVERY node it passes through, for the duration of the stay at that node. If this were not the case, and a link between nodes were down (or the BBS at the other end of the link is down) then the NTS message would be delayed, and not be visible to any user, until the link or distant BBS returned. This would result in a delayed NTS message, with NO confirmation or information to the originator that the message is not getting through.

The skepticism on the part of many NTS operators comes from the need to trust a distributed system of unknown (at the moment of sending) reliability to get the message through.

I use packet nearly every day to communicate with folks, but often will ask when on a voice mode if they got the message or not.

>
> Yes, a standard addressing scheme needs to be developed (and enforced,
>no fair having sysops do a bunch of manual corrections for people.)
>With a standard header scheme, the intermediate nodes could hide
>data, removing this temptation.

As noted above, it is not "temptation" that causes trouble. If an intermediate BBS allows a user to list the traffic, and to KILL the traffic, then that user has assumed responsibility for the message. It does not matter if the message gets to the "right" BBS near the destination zip code, just so long as SOMEONE is able to pick it up, and kill it, and have that ONLY HAPPEN ONCE!

If the traffic travels by more than one path, the scheme you mention is
not reliable. It might help, but it is another solution that provides a
partial fix, while still allowing for duplications under "some" circumstances.

|> awoodhull@hamp.hampshire.edu
|>

I am running Linux on an i386.. I also have another system that I SLIPped into
the Linxu box. I had no problems getting it to work "right of of the box." I was able to telnet from NOS into
Linux and the other way.. also I was able to FTP back and forth. I also have a slip login to the internet.. and
was able to use the Linux box as a gateway into the internet from the NOS system. I have not gotten the TNC up
and going yet.. and have had to pull the NOS system down.. I do play on doing basicly the same thing with a
gateway.. but I have not had the time to work on it quite yet..

Hope this helps.. If you have any questions, let me know.

Tom

925. MORE G-TOR INFO

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-04-06 19:18:54 UTC
From: BJARTS@stthomas.EDU
Message-ID: <01HAUTXW3TO291WQ55@stthomas.edu>
Source record: 49727

HERE IS SOME MORE INFO ON G-TOR. THIS INFORMATION COMES FROM THE KAM PLUS
REFERNECE MANUAL FOR VERSION 7.0 PAGE 42.
"REAL-TIME MONITORING OF LINKED G-TOR STATION WILL REQUIRE A FAIRLY FAST
COMPUTER(286/16 or better). THIS MONITORING USES THE GSCAN FUNCTION
OF YOUR KAM FIRMWARE AND PROCESSES THE DATA IN YOUR COMPUTER. FOR
SLOWER COMPUTERS, YOU MAY USE THE GSCAN FUNCTION TO CAPUTRE THE RAW DATA TO
A DISK FILE. THIS ALLOWS YOU TO USE THE GOFF PROGRAM TO VIEW THE DATA,
ALTHOUGH IT WILL NOT BE IN REAL-TIME."

ALSO HERE IS A NEW GLITCH IN THE HOSTMASTER SOFTWARE VERSION 3.2 THAT IS
USED WITH G-TOR. THIS PROBLEM HAS OCCURED ON PACTOR AND G-TOR SO FAR.
WHEN USING THE BACKSPACE TO EDIT IN THESE MODES, THE TNC TRANSMITS THE
BACKSPACE, IT DOES NOT EDIT LIKE THE MANUAL SAYS IT WILL. HERE IS A QUOTE
FROM THE KANTRONICS HOST MASTER II+ ver. 3.2 MANUAL, PAGE 80.
"IN G-TOR AND PACTOR, ALL CHARACTERS ARE SENT TO THE TNC AS YOU TYPE THEM.
THIS MEANS THE BACKSPACE CHARACTER IS TRANSMITTED- EDITING IS POSSIBLE
AND WILL BE DISPLAYED ON YOUR SCREEN AND ON THE REMOTE STATIONS SCREEN."

I HAVE TRIED THIS AND IT SEEMS NOT TO WORK. I HAVE LEFT MESSAGE ON WA2MFY's
PACTOR PBBS AND HAVE DONE SOME ON AIR EDITING TO TEST THIS. THE EDITING
SEEMS NOT TO WORK AT ALL. I HAVE ALSO NOTICED THAT AS EACH LETTER TYPED
IN THESE MODES, IT IS IMMIDIATELY TRANSMITTED. IT MAYBE THAT I AM DOING
SOMETHING WRONG, BUT SO FAR NO LUCK. THIS DID NOT HAPPEN ON THE PREVIOUS
VERSION OF HOSTMASTER II. OH WELL LET KEEP PASSING ON ALL THE NEW
INFO ABOUT THE NEW PROGRAM AND THE NEW MODE.

I'M STILL LOOKING TO SET UP SCHEDULES WITH ANYONE WHO WOULD LIKE TO TRY OUT
THIS NEW MODE. YOU CAN REACK ME AT THE FOLLOWING:

BJARTS@stthomas.EDU wrote:
: THE FOLLOWING TEXT WAS PICKED UP FROM THE DL2FAK PACTOR MBX IN GERMANY
: BY VE2FK IN MONTREAL. IT WAS WRITTEN BY DL2FAK, ONE OF THE DEVELOPERS
: OF PACTOR.
:
: G-TOR - An Improvement?
:
[]
: The Golay encoding however, as used in the G-TOR mode, is only able to correct
: 3 bits in a block of 24 bits and only half of this block (12 bits) carries in-
: formation. The remaining 12 bits have to contain the required redundancy, and
: no new data. It is therefore only possible to correct a few errors despite the
: large overhead. For this reason the Golay encoding would only be useful for
: errors caused by short spikes on the higher short wave frequencies (10 to 20m).
: You cannot however expect it to provide any improvements in typical 80m con-
: ditions. Here it is necessary not only to use hybrid-2 ARQ systems, but also
: suitable, powerful (invertible) codes, which allow the reconstruction of the
: original information, even when only the redundancy block is received, rather
: than Golay or similar simple block coding, which always requires both blocks
: to be received to get the data transferred.

My understanding is that G-TOR uses an extended Golay (24,12) code that
is, in fact, invertible. What G-TOR does is to send the data block,
then if and only if an error occurred, it sends the Golay "parity" bits
as a block. The receiving station can derive the data from either of
these blocks if the block is correctly received. If it is not, the
receiver can pass the two received blocks into the Golay decoder for an
attempt at error correction. This, I suspect, is a substantially more
powerful scheme than memory ARQ, although I don't have good data on
hand to back that up.

: The most robust HF (short wave), narrow band, data transmission systems known,
: apply very powerful convolutional codes with Viterbi decoding and soft deci-
: sion (requiring an ADC/DSP just like analog Memory-ARQ). The processing speed
: of those systems exceeds the capability of a KAM by factor 100. Despite this
: very expensive approach, they only achieve around 10 dB better weak signal
: performance than PACTOR-1. The closer a system approaches the Shannon boundary
: (theoretical throughput limit) the more difficult it gets to gain another one
: or two decibels.

Perhaps, but 10-dB better in what environment? AWGN? That's not the
environment of interest at HF. If the 10 dB figure is for a real-world
environment, I'd be interested to see the reference it's from.

: W0XI et al claim that they were able to transfer a certain file on the 20m
: band in about 5 minutes using G-TOR, whereas PACTOR, which was used afterwards,
: took about 20 minutes. The conclusion was that G-TOR would be about 4 times
: faster than PACTOR in general, which is actually impossible!! According to the
: system description, G-TOR can on average only be about 1.5 times faster than
: PACTOR.

Impossible? Not if G-TOR is correcting errors using fewer
retransmissions than Pactor requires.

[]
: Regardless of the Huffman data compression, which improves the throughput of
: both systems in the same way, the comparison of throughput between PACTOR and
: G-TOR can be easily calculated. According to the protocol description pub-
: lished by W0XI, G-TOR is able to transfer a maximum of 19 characters per se-
: cond when running on 200 baud (They claim 69 data bytes in a cycle duration of
: 2.4 seconds at 300 baud, which means maximum 2/3*69/2.4 characters per second
: at 200 baud). The maximum rate of PACTOR at the same speed is 16 chrs/s, which
: is a relationship of 1.18 to 1. The Golay encoding is not able to improve the
: throughput so dramatically that you finally result in a factor 4. It must be
: remembered that the analog Memory-ARQ, as used in the original PACTOR imple-
: mentation, is able to improve the effective signal-noise ratio with each ag-
: gregated packet and hence enables a higher throughput (especially in weak con-
: ditions) than the Golay coding gain. It is therefore obvious that the higher
: maximum throughput of G-TOR is mainly based on its higher maximum baudrate.
: This however means, it has to exceed the usual 500 Hz band width limit.

Again, this discussion neglects to consider the error-correcting
capabilities of G-TOR. (It would be interesting, though, to add
memory ARQ to G-TOR, particularly with soft decisions.)

: With this in mind it must also be remembered that a wider receiver bandwidth
: receives more noise. A 300 baud G-TOR signal will therefore have a poorer S/N
: ratio than a 200 baud PACTOR signal (if they are both of the same fieldstrength
: and the receiver bandwidth is correctly adjusted for both modes). As signals
: decrease, G-TOR would have to switch to 200 baud before the PACTOR signal
: would be affected, thus further reducing some of the proposed speed gain.

This is true. it might have been better had G-TOR stuck to a 200-baud
upper limit. We have enough wide-bandwidth signals on the bands now.

: There are still some more disadvantages of G-TOR in comparison to PACTOR, e.g.
: the cycle duration is quite long at 2.4 seconds, and will increase to almost 5
: seconds when using the Golay encoding, hence leading to quite long break-in
: times. The speed adaptation times are necessarily also longer, thus leading to
: poorer results in rapidly changing conditions (multipath).

No, the cycle time is not affected by the encoding because of the
alternate-block transmission scheme I mentioned earlier. 2.4 s is the
actual G-TOR cycle time.

: Furthermore, the interleaving and the 3 different baud rates used in G-TOR will
: probably lead to a lot of problems with the listen mode, an important point for
: all digital modes used in Amateur Radio.

Possibly. Kantronics has a monitoring program for the PC. I've not
yet seen it in use yet, but we have a copy in-house here.

: Actually G-TOR is just a modified PACTOR system, which probably does not pro-
: vide enough improvement that introducing this mode as another new standard
: would be worth-while. With regard to the basic requirements of each digital
: data transfer mode (like throughput, bandwidth, error rate, etc.) PACTOR al-
: ready represents nearly the optimum attributes that are obtainable with an FSK
: system. A real improvement over the current PACTOR system can only be reached
: when using different modulation schemes like PSK, which require a DSP hardware.

I'd say it's substantially more than a modified Pactor system! It uses
different timing, different coding and a vastly different
error-correction system. You might as well say Pactor is a modified
AX.25!

: This step will be done this year with the introduction of PACTOR Level-II.

It will be most interesting to see G-TOR and Pactor-II go head-to-head!
May the best protocol win.

In article <2nqhsn$f9s@network.ucsd.edu>, brian@nothing.ucsd.edu (Brian Kantor) writes:
|> In article <2nphhd$djt@hpbab.mentorg.com> Hank_Oredson@mentorg.com writes:
|> >You are perhaps talking about the internet, which chose to ignore
|> >the existing use of NA in one of it's connected networks?
|>
|> Oh jeez, Hank, stop making things up. The AMPR.ORG domain has never used
|> the ham bbs hierarchical routing/addressing scheme to name hosts.

We were not discussing host names. We were discussing email addresses.

Please do not confuse a host name with an email address, this is one of the
worst mistakes an email system designer might make.

But since you brought up the topic, why would AMPR.ORG *not* choose some
sort of rational subdomain naming convention for host names?

Perhaps the fact that they didn't, and that they consistently confuse email
addresses with host names is why it is impossible to move email from
one tcp/ip system within .ampr.org to another without making use of those
"other" (BBS network) email addresses?

But now back to our scheduled discussion of email addresses.

|> With some exceptions, the namespace of the AMPR.ORG domain consists
|> solely of callsigns within the domain. Names are not routes, routes
|> are not names, and mixing them up is one of the worst possible mistakes
|> a network architect could make.

Well gee Brian! Glad you least understand the basics!
A name is not a route.
A route is not a location.
An address is none of the above.
Etc. etc.
So *WHY* do you persist in confusing them?
Repeat after me "A host name is not an email address."

|> That means that whilst you might see
|> W0RLI.AMPR.ORG
|> or
|> BBS.W0RLI.AMPR.ORG
|> you won't see
|> W0RLI.#NNJ.NJ.USA.NOAM.AMPR.ORG
|> or the like

And why would I not see such things?
Why would we not use subdomains in our email addresses?
Why would we not put routing hints into our email addresses?

Why would we not identify our email address by it's internet domain name.

Why wait! Look at my signature!
It has ".mentorg.com", which clearly is an internet domain name!
But wait ... there is something missing - the subdomains.
Why are they missing? Because a router with address "mentorg.com"
will take care of translating the (missing) portion of my email
address once email addressed to the "mentorg.com" domain arrives
there. Where is "there"? Well, that depends on where your email
to me started ... "there" might be NJ or OR or Bracknell or Singapore.
At any one of these locations email destined for <x>.mentorg.com
is re-routed by adding the rest of the address.

So the rest of the world does not need to know about .hanko.mentorg.com,
nor about .hanko.moses.mentorg.com, nor about
hanko.moses40.moses.mentorg.com

We use ABBREVIATIONS and ALIASES for the actual addresses.

What does this have to do with the ham radio digital network?

In the ham radio digital network, we do not yet use aliases nor
abbreviations. We specify the whole email address.

(Note for Brian: this is NOT "source routing" since we do not specify a
route, but specify an address).

Look again in my signature. I show a ham radio digital network email
address. There is *no* "host name" in that address. There are in fact two
hosts that may handle email addressed to my address: RLIMB:W0RLI-2 and
WLINN2:W0RLI-4. These are the host addresses within the AX.25 network.
In the CLOVER network, that first host is named W0RLI. This is not
confusing to anyone, because the W0RLI name is only known in the CLOVER
network, and the RLIMB and WLINN2 names are only known in their respective
AX.25 networks. If I had a tcp/ip system on air, it would have an ip address.

Most folks have no trouble distinguishing between the email address and the
host name. It is not a complicated thing. In fact it is very simple:
email destined for email addresses of the form ".OR.USA.NOAM" may be sent
to any of the hosts listed in the previous paragraph, and it will be
properly delivered. Oh yes - email addresses of the form ".WA.USA.NOAM"
may also be sent to these hosts as well. If you want email to reach me
personally you may send it addressed per my signature, and to any of those
same hosts.

Brian, now that you have again told us "Don't do it that way" would you please
oh please tell us "The right way to do it."

... Hank

: What would prevent duplicates or lost messages?
: How would you accomplish this? Remember we don't have a "fixed
: configuration" network. We don't have reliable paths. We do have multiple

I don't understand. There are fixed routes in and out of any full service bbs. The HF routes may seasonally change and require manual assistence. What is going to happen if the BBS protocol is allowed to be the rule on the DASH digital amateur super highway. It is my understanding that the proposal for the 219 MHz 56kb DASH will require point to point auxiliary operation. Will the bbs protocol work in this new arena?

: ways to get from point A to point B. We don't have a protocol that
: addresses all the problems, and would *love* to have one.

: Any suggestions would be most welcome.

: I hope we will hear from the networking gurus on these topics.

: So far, we have heard from a couple of the networking gurus.
: Their message has been "You are doing it wrong."
: I presume they will follow up with "And here is how to do it right."

: ("just use tcp/ip" is not a reasonable answer. We don't use it.)

Maybe the answer is to make the 219 MHz DASH a tcp/ip network and put the bbs mail traffic into <envelopes> for safe transport across the network. I would like to see some more discussion on the future implementation of this new network.

Has anyone done any traffic analysis of bbs messages? Are the bulk of the messages two or three hops? With the increase in network speed will the message flow naturally increase? Will my bbs mail reading program be able to keep up with the vast number of bulletins that will be arriving? I realize that I will be reading at 1200 for quite some time ... maybe 9600 if the bbs operators will provide this service.

Sorry Hank, I am not a network guru, just your average packet user.

Bob

From: kinzer@dtsdev0.sps.mot.com
Message-ID: <1994Apr7.000403.29950@newsgate.sps.mot.com>
Source record: 49722

In article <CnunKr.6D3@world.std.com> dts@world.std.com (Daniel T Senie) writes:

>If the traffic travels by more than one path, the scheme you mention is
>not reliable. It might help, but it is another solution that provides a
>partial fix, while still allowing for duplications under "some" circumstances.

It is entirely reliable, if and only if the traffic is only allowed
to be removed at a particular destination. Deletion of the message was
specified by content only, and header information is to be ignored
by the the hash algorithm. This allows duplicates that have taken
different paths to the (one and only one allowed) destination node
to be eliminated.

The continuing problem (as I understand it from the discussions here)
is that the NTS does not require the operator taking the message off
the board (killing it) to generate a reply saying it has been received.
If the traffic has made it to the destination, there is a high probablity
that the reverse path will get the reply to the originator. This is
not a problem with the BBS system, it is a problem with the proceedures
developed by the NTS folks for passing NTS traffic through it. This
decision (no reply needed) has forced the situation where the traffic
has been considered passed when it is entered into the BBS network,
rather than the actual truth, which is that the traffic has been passed
when it is removed.

I would propose that if the NTS folks would agree to:

1) Put expiration dates in the message so that no one will deliver
a message after the timestamp.

2) Send a reply message that the message has been picked up.

3) Pick up mail for each destination area from the designated node.

3) Deliver or send the message another route if a reply is not received
by the expiration time plus some time limit.

And the BBS people would:

1) Implement the algorithm for deleting duplicate content messages that
arrive on the designated node.

Then, most of the complaints would be addressed. This still leaves
the possibility of duplicate messages being generated if:

A) The return path takes more time than the "time limit" mentioned
above.

B) The return path is blocked entirely for some reason.

These two problems are the kind of thing that the BBS operators are probably highly willing to solve. They will not be resolved while there are so many many variables that are out of their control causing problems. They *cannot* be solved without some information. A duplicate message delivered ought to be the beginning of a problem report, not the beginning of a cussing out of the BBS network. I'm not too sure what needs to be included, but no doubt the BBS operators need the originating BBS, and the destination BBS, and the problem that occured (message didn't make it [no reply] or slow reply [reply received after duplicate generated and passed via alternate means] or reply didn't make it [duplicate generated with no reply received.])

It wouldn't hurt if the NTS receiving op that accepted (and killed) a message that was past it's deadline would send a reply that it was killed without delivery. That could be the start of a problem report that the forward direction was too slow.

Yes, it means that a different protocol needs to be developed and used by the NTS. The complaints being issued makes this obvious, and the proceedures now in use seem unsuited to the medium. That's not the BBS operators fault.

Yes, it means that the BBS operators need to do some changes to the system software in order to make it more useful. Messages arriving by multiple (BBS) paths are causing problems, that's not the NTS folks fault. It would also seems that they could use a couple of features like zip-code to BBS node mappings, and auto reply with something like "accepted for delivery" and "killed, past expiration" responses. It's not my place to decide the needs, that falls on the NTS.

Yes, I've gone on this diatribe far too long. I see a lot of people trying to do good here, maybe this kick in the rear will have helped. It at least represents a fresh viewpoint, as I don't participate on either side of the fence here. I'll shut up now. Thanks for everyone's patience.

Anyone have the manual for a Televideo 925 terminal? I have purchased one second hand, and would appreciate any information about the two banks of DIP switches at the back of the terminal. One is labelled baud (but no explanation of what switches select which speed). The other is labelled function. I believe that there is also a third bank of switches inside the unit. Any help would be appreciated.

Thanks,

John Welch

933. Mail Routing (was NTS traffic on packet)

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-04-07 05:00:29 UTC
From: jangus@skyld.grendel.com
Message-ID: <765694829snx@skyld.grendel.com>
Source record: 49724

OK, here's the situation as I see it. (Your milage may vary etc.)

Joe Ham in Billings Montana wants to send a message to his buddy in
Bangor Maine.

Joe would like to know several things.

1. That his message will get there intact and in a reasonable
amount of time.
2. If not, why not. (And where did it go wrong)
3. That his buddy will not get the same message every day for
the next three months.
4. Finally, that if his buddy wants to reply he can. Easily.

For what its worth, Joe Ham has the same concerns about his rusty tower
sales bulletin making it all he way out to California in the hopes that
someone with a pickup truck will drive out and pick it up locally. And
since it's Mothers Day and cards cost money, Joe Ham would like to send
an NTS message to his mom.

Now, how are we (the BBS operators who are crazy enough to want to) do this?
I suggest that we as a group switch over to the method used to deliver UUCP
mail. We have the means to have every HAM be a unique uucp site if needs be.
We can group bbses into domains if they want to or we can assign each bbs
its own domain. (Sort of the Californians dream with regard to repeaters.)
Since machines used for BBS nowadays are probably 386 or better with 200
meg drives or bigger, it shouldn't be a problem to start implimenting the
things used to move mail the same way that UUCP mail is handled.

So, the name of the host bbs would become wa6fwi.BBS for example. (BBS so as
not to get it confused with a registered UUCP name such as grendel.UUCP)
You would send mail just like the other (current) way, SP KF6PU@WA6FWI. The
big difference is NO ROUTING INFORMATION. None of the current .#soca.ca.usa
stuff. OK, so how does some BBS in Oregon (Hi Hank) know how to send mail to
wa6fwi? After all, I could be anywhere. The trick is a yellow page server to
tell Hank where to send the mail off to. The the routing table for W0RLI
would only have to make a few decisions. North, south, east, west and near
or far etc. One shove and off it goes.

The YP server only has to know that wa6fwi is in Carson CA and that it talks
to k6ve and wb6ymh. The sysops only have to know about their neighbors (or
perhaps one or two hops away). Yeah, almost like Net/Rom eh?

Of course, for a "known route" you could always send the mail with a forced
route. wa6fwi!k6ve!w8akf!ad8i@ad8i. Bang pathing. It should look familiar.

Replies are easy, by the time a message gets to its destination, a route has already been established. SR should work fine to kick it back in the direction it came from.

Errors. Errors can happen anywhere in the chain. Tracking and reporting them is the key to intellegent networking. If the message has taken a bad hop in routing, sooner or later a message is going to be generated "unknown host". If the host is truely unknown, or if it is only unknown by those around it, it should be identified as a problem. If the host is broken yet others know about it, it should generate the message "unreachable host". Finally, if the message gets delivered, the user should be known by the host system otherwise "unknown user" gets generated and sent back.

For what its worth, there shouldn't be any dupes or unknown disappearances of personal mail as a result of this method.

NTS mail gets renamed from the "old" (current) 90479@NTSCA to the "new" nts@90479. anyone loggin into a BBS should be able to read and (if needed) kill messages to nts. No, using 90479 as a host name isn't a contradiction to what I said earlier about no routing information. The name 90479 can be aliased to one or more actual bbs names depending on who is servicing the zip code. When a message is killed as delivered, an autokill message can be sent to service@90479 (same multiple destinations) to service the message. No dupes unless two people happen to download for servicing at the same time from two different bbses.

Bulletins. They get a Distribution: field. Each bbs knows where it is in the general scheme of things. If it is handed a bulletin that is within it's own area. (with reference to the distribution field) it gets published locallly. If not, it just gets passed along until it gets where it does belong. For example, sb towers@texas gets passed along (a single path) until it gets to the bbses that claim to be in texas. Then it spreads based on a locally known distribution scheme and gets published (made viewable). This also should solve a problme brought up here from time to time about "how do I send a bulletin just to new hampshire from florida without leaving a slime trail between both places?"

(Of course, we could copy the usenet news method for bulletins (er, news).)

How much needs to be known and who gets to be responsible for knowing it? Everyone should at least know who their neighbors are. At the least, all systems should be on a list somewhere. Perhaps (since we use callsigns) we could break up the list into regional lists. I know, there is an N2 station running a bbs here in california. No problem the 2 list is back east and it lists the information for the n2 station. Even if it is out here. It would NOT be listed in the 6 list maintained out here. (in California land). And so forth. There can (and should) be a major list of the minor lists maintained as well. For example, I can find out who the list holder for w6 stations and who is the list maintainer for all the dl stations etc.

Finally, who is going to write this stuff? A lot of it is written already. It is called sendmail and runs on Unix platforms. A 386 with a 60 meg drive and 4 meg of ram can handle it. But, I might add, uucp mailers are available for

Macintosh and ms-dos machines. Like most endeavors in life more is better but enough is sufficient. How do we know what to do? A lot of that is documented as well. RFC822 comes to mind. A book such as UUCP and usenet news and mail by O'Reilly and Associates is a good place to start on how to see how this works. No, I'm not suggesting that we ALL go over to running tcp/ip. (Although that's not a bad idea....) But, if we rewrite the way mail is handled in a rational manner, it can work seamlessly with tcp/ip and the internet. This as they say is a "Good thing"(tm).

How do we write the new code? Write it all in ANSI C. Link the hardware calls with assembly language modules. Make it modular. Make it public. Make it a group effort. (Sort of the way tcp/ip is being done now) Make the mailer different from the BBS, then run them both at the same time. If we do this right, (think IBM and open architecture and clones) we can have a packet mail system second to none that anyone can write applications or user interfaces for.

All it really takes is a bit of time to map out the strategy of combining the things that make amateur radio's packet BBS network as it is now with the way things are done with uucp mail in the "real world". I say "real world" not to slam the amateur aspect of what we are doing, but because that is how millions of bytes are transfered every minute of every day 7 days a week all year long.

Sure, there are a lot of items to be detailed to make this work. I see it a a goal. What about tcp/ip? Perfect. If people want a bunch of systems to run in an interactive lan type environment, fine! They can move messages in and out of the "new" system seamlessly as well. Minimum impact.

Anyways, I hope that by putting this all out in the form of a message you all have something to think about in unison. Don't think of it as reinventing the wheel, think of it as discovering that wheels work better if they are round.

934. FCC Packet Message Forwarding

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-04-07 05:11:17 UTC
From: chuckv@comtch.iea.com
Message-ID: <2o04ll$36p@krel.iea.com>
Source record: 49650

Well it's final.... Here is the latest rule from the FCC.....

Report No. DC-2582 ACTION IN DOCKET CASE April 4, 1994

COMMISSION AMENDS RULES CONCERNING MESSAGE FORWARDING
SYSTEMS IN THE AMATEUR SERVICE
(PR DOCKET NO. 93-85)

The FCC has relaxed the amateur service rules to enable contemporary message forwarding systems to operate at hundreds of characters per second while retaining safeguards to prevent misuse.

A message forwarding system is a group of amateur stations participating in a voluntary, cooperative, interactive arrangement where communications from the control operator of an originating station are transmitted to one or more destination stations via forwarding stations, which may or may not be automatically controlled.

Currently, the control operator of each station is held individually accountable for each message retransmitted, resulting in unnecessary content review and delays. The American Relay League, Inc. (League) stated that the obligation of the control operator of the first forwarding station should be the establishment of the identity of the station originating the message. Only when this is not done should these control operators be held accountable for improper message content. Also, there are currently no central supervisory authority in an ad hoc amateur service digital network, making these unsupervised systems easy targets for misuse by uncooperative operators and non-licensees. Moreover, the Commission said that it could be difficult to establish after the fact that a particular VHF station originated a fleeting high speed digital transmission. For these reasons, the Commission said there must be on-going oversight of the system and the control operators of the first forwarding stations are in the best position to provide such oversight.

Therefore, the Commission will hold accountable only the licensees of the station originating a message and the license of the first station forwarding a message in a high speed message forwarding system. The licensee of the first forwarding station must either authenticate the identify of the station from which it accepts communications on behalf of the system, or accept accountability for the content of the message.

(over)

The Commission also clarified that the station that receives a communication directly from the originating station and introduces it into the message forwarding system is the first forwarding station.

The League and the Colorado Council of Amateur Radio Clubs suggested that the Commission substitute the word "simultaneously" for "instantaneously" in the redefinition of a repeater. The Commission concurred and adopted this modification.

The Commission believes that these rule changes will enable contemporary high speed message forwarding systems to operate as their designers intended, while retaining the minimum safeguards necessary to prevent misuse.

Action by the Commission March 30, 1994, by Report and Order (FCC 94-76). Chairman Hundt, Commissioners Quello and Barrett.

938. New BBS rules

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-04-07 15:14:32 UTC
From: enge@enge.almaden.ibm.com
Message-ID: <2o180o$f0a@juniper.almaden.ibm.com>
Source record: 49730

Here are some tips for AA4RE BBS SYSOPs and the new rules:

To hold all bulletins created locally, put the following in ACTION.BB

```
REVIEW B & % yourcall
REVIEW B & ^ % =*
```

To prevent unregistered users from creating bulletins, put the
following in ACTION.BB

```
DENY_NEW_MSG 4 B & C U
```

You also need something in MESSAGE.BB like

```
: 144 N
You must be registered to send bulletins. Please issue the
REGISTER command first.
```

You can also require user authentication before the send command
to ensure the user's identity.

> ETransfer aborted by remote R
PacTOR II update.

THE FOLLOWING TEXT CONSISTS OF TWO SEPARATE MESSAGES FROM DL2FAK TO
TWO DIFFERENT HAMS IN NORTH AMERICA. THEY ARE UPDATES ON PROGRESS IN
THE DEVELOPMENT OF PACTOR II.

THE FIRST IS A MESSAGE TO VE2FK IN RESPONSE TO HIS QUESTIONS TO
DL2FAK. THE DATE OF THE MESSAGE IS OCT 25, 1993.

THE SECOND IS A MESSAGE TO W9UWE. THE EXACT DATE OF THE MESSAGE IS
LOST, BUT IT WAS SOME TIME IN LATE SUMMER, 1993. IT IS INCLUDED HERE
EVEN THOUGHT THE FIRST MESSAGE CONTAINS MORE RECENT INFORMATION
BECAUSE IT DESCRIBES THE ADAPTIVE MODULATION SCHEME WHICH WILL BE
USED. (de W0MFK)

HERE IS A COPY OF THE ANSWER OF TOM DL2FAK, ON MY REQUEST FOR MORE
INFO ON PACTOR-II, FORWARDING, TYPE OF COMMANDS, ETC.

Hello dear Claude,

Tnx mail. Glad to hear that everybody is already looking forward to PACTOR-II.
The PTC-II will of course also be capable of PACTOR-I, thus the new unit is
compatible with the current PTCs. It will also provide at least one Packet Ra-
dio Port to allow PR access to the built-in mailbox. The mailbox memory will
be much bigger than in the current PTC, probably up to about 200k Bytes if
the 256k RAM is used. Normally the PTC-II will probably be delivered with 32k
RAM, but one should also be able to order more RAM initially or change the
chips afterwards. The software will automatically detect the size of the RAM.

There is of course no need to run additional PC-software for the mailbox
system to be available, it will all be handled in the PTC-II itself, like in
the current unit. S&F capability for Packet Radio on VHF and PACTOR on HF
is not planned to be realized in the early stage, since there is already
a lot of PC software available providing these features. Nevertheless, as
there have to be software updates as well, we will probably build in S&F
options as well. By the way, we are not going to change the syntax of the
mailbox commands for several reasons. The main one is that the PTC must allow
'normal' traffic in any case. If the commands would be in the Aplink-style,
you were no more able to enter sentences which are not intended to be a box
command, so the two slashes are used to distinguish a mailbox command from
normal QSO traffic or other commands which control additional mailbox- or ter-

minal software (e.g. the '++'-commands which are used to operate the remote access and the binary data transfer in the latest version of our terminal software 'MT.EXE')

By the way, as the STI chip is no more available, we have a new hardware design as a successor to our 'normal' (ADC-) PTC under development. This so-called 'PTC plus' will probably be available early next year. In this unit also a 68000 CPU will be used. The command syntax will be similar to the current PTC, but there will be some more interesting features due to the increased CPU power and the bigger memory (the 'PTC plus' will also be able to carry up to 256k RAM, hence the mailbox memory can already be much bigger in this unit).

PTCLEV.II

Due to the amount of inquiries concerning the new PACTOR Level II, I will herewith provide some information on this item.

Hoever, since we are only in an early step of the development, we cannot give final information on the Level II protocol details yet. This message therefore mainly refers to a lecture, which Peter, DL6MAA, gave at the Hamvention in Dayton this year. He was talking about first results, which have been obtained using the new DSP-PTC hardware, but all this is still preliminary and subject to change in order to achieve further improvement. Despite this fact, the speach caused a lot of interest and excitment.

At present the Level II signal is planned to be basically similar to the current system, featuring 2 tones with 200 Hz. shift, using speeds of 100 or 200 baud and fitting into a 500 Hz. channel. Depending on the band conditions, the data throughput should be increased by changing the modulation forms: in bad conditions probably differential BPSK (2-PSK) with QRG diversity will be used, then D-BPSK without diversity, followed by D-QPSK (4-PSK) and finally D-QSPK at 200 baud. Thus there should be a maximum throughput of 800 bits/second, which is already faster than CLOVER....
Besides that, in poor conditions the system will use a combination of Memory-ARQ and error control coding. We therefore expect the minimum required SNR to be around 7 db. lower than in the current system.

Please remember that PACTOR II and the DSP-PTC will probably not be available on the market before next year.

942. TCP/IP from car w/PK-88 (Help)

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-04-07 16:37:01 UTC
From: adoane@interaccess.com
Message-ID: <adoane.765736372@interaccess.com>
Source record: 49734

I have just recently purchased a laptop, and since I have a PK-88 here
I have not used for a year or so, already have a 50w VHF radio in the car
that doesn't get much use (I'm a UHF nut), and I already have a TCP/IP
address allocated to me, I would like to use TCP/IP from the car.

I understand that TCP/IP is not designed for moving stations, and that
it wont work well if I am moving. My question to everyone is mainly what
flavor of NOS or KA9Q should I use for a laptop and a PK-88 ?

I realize this question is almost like asking what is the best car to buy..
I expect many different answers-- and thats ok.

Thanks,
Andrew (N9KET)

I must have missed this somewhere, possibly in an otherwise uninteresting
thread. What is this 219 Mhz DASH? Never heard of it.

Transport BBS traffic via tcp/ip? No objection here.

I would ALSO like to see more discussion on ANY new network.
But, let's make it a coordinatoed effort, with wide support, not
something that one little niche does and has to kluge an interface to
their neighbors for.

So tell me, what is this DASH thing?

|> Is that doable, Hank?

You might investigate the SR command ... "Send Reply" ...

We are talking about humans picking up and delivering messages that
were entered into the system by other humans. A simple reply message
stating "I took your number xxxx and delivered it" is awfully simple.

Automating the process is of course possible, but gives no information
on whether the person who took ("Killed", in BBS terms) the message
actually DID deliver it.

In the olden days, there was an automatic response to the act of killing
an NTS message at a BBS. The ARRL came to the conclusion this was not
very useful, as it did not convey the required information "I delivered
it".

So there are several different levels or types of confirmation that might
be provided. If messages are getting "lost" then the NTS folks involved
might as the sysop to check and find out what happened. This is a normal
BBS sysop function; verifying that links actually work, that messages
actually move to their destinations. BBS systems keep track of each
message; who forwarded it to me when, who did I forward it to when.
Following this audit trail is not at all difficult - we do it all the time
to discover and repair problems in the network.

Anything is possible - "It's just a Small Matter Of Programming".

Once NTS (or ARRL or ?) formulates a plan and submits it to the BBS
authors, expect to see things happen very quickly.

To date, no plan, thus no action.

Sounds to me like some NTS folks need to talk to the BBS sysops involved,
and give them some guidelines on how NTS would like it's traffic handled
within the BBS network. I would expect NTS to contact me (as well as the
other BBS authors) about these issues; they have not done so.

|> The skepticism on the part of many NTS operators comes from the need to
|> trust a distributed system of unknown (at the moment of sending) reliability
|> to get the message through.

Have there been major problems? Does the NTS liason who takes the message
and delivers it notify the NYS liason who put it into the BBS network? If
they do, what sorts of problems are seen?

At least in this area of the country, I hear a lot of whining from the NTS
folks, but when I look at my own BBS system I see *all* NTS traffic
clearing within 24 hours - to any part of the US and CANADA. The only
traffic that remains "stuck" is traffic destined to my local area.
Sometimes no NTS liason checks the BBS for several days.

|> I use packet nearly every day to communicate with folks, but often will
|> ask when on a voice mode if they got the message or not.
|>

Why not ask on packet?
The SR command is not really all that hard to type.

|> As noted above, it is not "temptation" that causes trouble. If an intermediate
|> BBS allows a user to list the traffic, and to KILL the traffic, then that
|> user has assumed responsibility for the message. It does not matter if the
|> message gets to the "right" BBS near the destination zip code, just so long
|> as SOMEONE is able to pick it up, and kill it, and have that ONLY HAPPEN
|> ONCE!

And if there is any doubt about who took the traffic from the BBS system, the BBS log files can confirm who took it, when they took it, etc.

If NTS wants confirmation of the point of exit from the BBS system, a simple SR and message with "I took your number xxx" is all that is required.

At least G-TOR only upshifts to 300-baud when it has enough data to
justify it. It doesn't take up the wider bandwidth unless it needs to.
I don't see anything wrong with taking up bandwidth as long as you're
not wasting it.

On the topic of NTS messages in particular, and the use of BBS's versus
other NTS transfer modes (voice, CW or even RTTY or AMTOR between live
operators), it is then clear that the liklihood of duplicate messages
increases on packet BBS systems. I admit that if things are operating
"properly" this should not significantly increase the chance of duplicates,
but it does exist.

>addresses all the problems, and would *love* to have one.

The definition of the word "protocol" is key here. It is not the transport mechanism per-se that causes the problem. What you are dealing with is a store and forward messaging system. In the OSI Reference Model, we're talking about a layer 7 application. So, TCP/IP versus AX.25 is totally irrelevant.

What is needed here is a positive acknowlegement handshake, perhaps somewhat more robust than is currently done. I may be able to propose a better scheme than is currently used, but would like to know how the mechanism currently works, in detail, before proposing fixes to it. What I'm looking for would be a specification (in english, not in a computer language) that documents the handoff procedure used for transferring messages between systems. As with any protocol, an accurate specification with all state transitions worked out leads to successful and reliable data transfer.

>

As I said above, the network and transport level protocols are not the issue here. Let's see if we can fix the application level protocol that is at issue.

There is a way to request delivery by a specified date. Part of the
standard fields in an NTS message. The HX (handling) codes cover this.

>
>2) Send a reply message that the message has been picked up.

This is also covered by an HX code.

>
>3) Pick up mail for each destination area from the designated node.

IF there is a packet operator (packet/NTS operator) willing to handle
traffic from the BBS, that's fine. It's all still a volunteer thing,
so if nobody wants to handle it, then the BBS should not ACCEPT that

traffic for delivery. There are well defined nodes in Massachusetts,
for example, that are good stopping points for any NTS traffic destined
for East Mass (K1UGM) or West Mass (K1MEA) traffic. If other BBS operators
wish to distribute the NTS traffic to more localized areas, it would be
helpful if they checked with NTS folks FIRST, to see if anyone would
be able to pick it up.

The problem here is NOT an NTS problem, NOR a BBS problem, but a
failure to communicate between the two groups. I am trying to make that
clear, because I want to see both groups address the situation and
come to an understanding that leads to BOTH groups improving their
abilities.

Agreed. I have a stack of dupe reports at home, which are going to be sent
off to the NEDA network folks.

>

All NTS messages, except those carring handling code HXG, are not supposed to be discarded without sending a service message back to the originating station (NTS originating station). Of course the return path taken for the NTS service message need not be over the same modes as the original message came by.

> Yes, it means that a different protocol needs to be developed and
>used by the NTS. The complaints being issued makes this obvious,
>and the proceedures now in use seem unsuited to the medium. That's
>not the BBS operators fault.
>

Perhaps the Send Traffic command on the BBS systems could be altered to generate the automated reply request, and all that. I think the idea of sending replies back has merit, but since NTS is oriented around handling a message across multiple media types (in the life of any one message), it would make more sense to automate the process on the BBS's. As for timeout and return operations, it is probably safe to assume that an NTS message which has not been delivered within a few days is at least potentially stale.

> Yes, it means that the BBS operators need to do some changes to

>
>-dave
>

Good ideas and input, and plenty for everyone to think about. A few items added to the ST (send traffic) command on the BBS's might help a lot in allowing for the person who put the message onto packet (not necessarily the NTS originator) to see that the message either WAS picked up by someone, or got stale after some number of days (perhaps the ST command needs to ask how many days the traffic can be around before going stale?).

Perhaps we need to start splitting this discussion thread. We have two general things going here:

1. Issues with duplications of messages and the protocol used for message transfer on BBS systems. This thread is looking for a technical solution to the transfer problem, which affects more than just NTS.

2. Methods for transporting NTS messages across the BBS system with enough feedback and features to allow for efficient NTS operation and enhance the level of trust in the BBS system with NTS people.

Comments?

Does anyone have any info on Graphic Packet program (gp152.zip) from DH1DAE. I downloaded this program from the ARRL BBS. The comments area specified for "Baycom type modems". I am also looking for a software TNC program, WA8DED. It is my understanding that this program is needed before this program will function. If anyone knows where I can get a copy of WA8DED software, please reply.

Thanks, Steve Wilson

We are using the the latest JNOS and have had similar problems. My Sun
running Solaris 2.3 refuses to talk to NOS using telnet, complains that
there ther is a protocol error. When I try telnet to NOS from my PC using
QVTNet, I have to hit enter twice for each line to get it to accept my
input. For some reason, our VAX running MultiNet has no problem making
telnet connections.

Is there an official list of what all the different hierarchial fields are.

I want both the old and new way....

Like North America was 'NA', and now its 'NOAM'.

This is so I can configure my BBS to deal with all of them.

Things have become a bit more complicated when I only connected to one system
and said everything goes there.....

I also want to know about countries, etc.

One question I have....why do we have continental descriptors.....couldn't
we do it the same as Internet.

....CA is Canada
....US is USA
....DE is Germany

Other than that it would cause a real name crash if a Packet Address was
entered into the Internet.

Source record: 49646

Hello all,

I'd like to play around with making a multi-mode black box that
can decode and encode all of the digital amateur radio modes out
there today. Basically a homebrew TNC I guess. At any rate, can
anyone tell me what modulation schemes and tone pairs are used for
the following modes? I'd like to know what modem chip I need and
what modes to program it to use.

For example: 1200 baud packet: AFSK - Bell 202 tones.

9600 baud (and faster) VHF/UHF packet:

HF packet:

RTTY:

Amtor:

WeFax:

Pactor:

SSTV:

Any others?:

And does anyone have any chip recommendations?

That was me.... I have the source, I even have a DR200 but trying to get hold of a Z80 C compiler which will do the necessary tricks for overlays etc to get the code to fit is not proving quite so easy. I daresay if I spent enough money I could get a commercial offering capable of doing it but it would be a lot of money for a one-off project. I did try the public-domain Hitech C (running under a CP/M emulator on my PC) but that won't do the necessary tricks. I haven't found a decent Z80 cross-compiler for the PC yet so I am open to suggestions.

Try looking at the 'eol' command on KA9Q. I think there is some trickery involved to switch from the DOS newline to the Unix newline convention (similar to transferring ASCII files via ftp) which might even be done with some negotiation when opening the telnet connection. Possibly some flavours of software do it better than others?

Yes, RTTY is usually FSK or AFSK. The common frequency shifts are 170 Hz (current) and 850 Hz (somewhat obsolete). It uses a 5 bit Baudot code, the details of which are in most ARRL handbooks. As a matter of fact, you would do well to pick up a copy and see what's in there on the subject; at least the older books had a good description. 73 DE K6DDX

Hank, an old time friend from the Twin Cities now in "exile" in Oregon
said about the BBS/NTS interface:
>
>'But in any case, stop trying to force fit things that were appropriate
>40 or more years ago to the present reality.'
>
>...
>
> ... Hank
>

Of course Hank is right about this. The "regular" NTS, something Hank and I and many others participated in years ago, was and is a training ground to learn message handling in a format useful in emergencies and for military use.

The problem is, the telephone is so ubiquitous and so low cost, that handling messages that may or may not get delivered rates right up there with exchanging re-tries on HF packet. (STA or otherwise). That being the case we are led to the conclusion that amateur messages are probably most appropriately directed to other amateurs. The catch is, not all of the potential recipients are interested in checking into nets or checking into BBS's. For those that are "connected" in that fashion --great. But there is no real reason that we need an NTS or perhaps a VHF/HF packet linkage for emergency messages any more. The existing alternative commercial systems are generally adequate and handle dramatically more message volume per unit time than amateurs are currently able to handle. The real contribution of amateurs today seems to be 'shadowing' the managers of emergency groups and providing point-to-point communications for the disaster team. In this application the hand-held and the portable repeater and the competent net control station really shine. None of it is part of the NTS (or BBS) format.

Our hobby is evolving and the pieces of it with which we grew up are becoming less relevant. Perhaps there will be new pieces which are important in their own right. For the moment, at its simplest levels, amateur radio provides some very positive social and technical experiences that justifies its existance and continuation. There are opportunities to be part of a group, there are opportunities for personal, social and intellectual growth. Utilization of those opportunites is the provence of the individual amateur. If she or he wants to experiment with traffic -BBS of NTS type--, contests, DX, rag-chewing, vhf tropo-DX, VHF/UHF FM , or buildeing it is there to be sampled.

Forty years ago the communications world was different and the choices available and the choices made were different too! Our current culture

really does not lend itself to the classic NTS format and activity and, as a result, we probably can expect it to gradually fade away.

If you have thoughts on where we may be evolving to I would very much like to hear them.

961. BBS-to-Internet address transformations

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-04-08 05:43:55 UTC
From: brian@network.ucsd.edu
Message-ID: <2o2qur$221@network.ucsd.edu>
Source record: 49656
Cross-posted to: rec.radio.amateur.digital.misc,alt.ham-radio.packet

[Some of you (well, Hank, anyway) seem to have missed this proposal the first time around. Here it is again.]

Any hambbs-to-internet gateway which forwards mail will be required to

1) be fully registered (both A and MX records) with
the AMPR.ORG domain server.

2) be able to utilize MX records for mail exchange on the
internet.

3) be capable of accomodating a routing table large enough to
handle all the ham packet BBSs that will be routing to the
internet through it, and automatically update that table.

4) be able to generate MX records as required and submit them to
the central ampr.org database maintenance robot, either
automatically or by hand.

The procedure is:

When mail arrives from an AX.25 bbs at a ham-to-internet gateway
system, the gateway

1) updates its routing table for that BBS to reflect the routing
hints contained in the return address.
E.g., mail arriving at the WB6KDT gateway

FROM WB6XYZ@WB6CYT.#SOCA.CA.USA.NOAM

generates a routing table entry of

WB6CYT #SOCA.CA.USA.NOAM
(or whatever the gateway needs to know to reach the bbs via packet)

2) the bbs from line is rewritten* as

From: WB6XYZ@WB6CYT.AMPR.ORG

and the mail is injected into the internet

3) An MX record for WB6CYT.AMPR.ORG is established (if it does
not already exist)**, pointing to the gateway system (in this
example, WB6KDT.AMPR.ORG) with a preference value equal to the
number of stations the message took to make it to the gateway
from the bbs where it originated.

Yes, it's a bit elaborate. But it's RIGHT. It's clearly the way it ought to be done. Let's do it.
- Brian

* Yes, rewriting addresses is supposed to be a sin. It's unavoidable when you change addressing methods between networks, so in this case we have to do it. I don't like that either but there's no choice.

** Yes, there's a timing problem here if a reply message is sent before the nameserver gets updated and propagated. It's a one-time problem, though, and could be solved by pre-registration. After all, how many BBSs are there near each gateway system?

Yes, I would exactly like to do that, automatically from NOS. Send the
fbb bbs a message with the from BBS that has the same address as that fbb
BBS. Example: I'm a NOS user, so I would be declared hb9vbc @ hb9vbc.ampr.org
I also use an AX25 BBS called hb9iap.srom.che.eu, so I would like to smtp
the ax25 bbs and tell NOS to use instead of the form sp xxx < hb9vbc @ hb9vbc
the form : sp xxx < hb9vbc @ hb9iap. Is this possible ???

As much as I would like to see amateur radio continue to provide useful
message handling systems for emergencies, Mr. Olson is right, our methods
and modes are obsolete in the modern world, except in very rare and limited
cases. If we are to be of help in this arena, and I think we still can be,
then we have to rethink our approach.

For those of us interested in digital modes, the challenge is to seamlessly
internetwork with the "information superhighway". The NTS message format
is not compatable with that goal because it was intended to be handled
with human interpretation and human intervention. We need to re-examine
the way we handle messages, and the format in which they are cast.

Key areas we need to examine are format, addressing, routing, and assured
delivery. RFC822 or X400 messaging standards give us frameworks for messages
that can transparently move over many disjoint networks. The ticklish problems
we face are in resolving a message addressee to a machine address, and in
dynamically building routing systems that can deal with our often transient
systems and links. (We should be able to act as bridges across broken

commercial links in time of emergency without having to handle messages by hand, and we should be able to utilize commerical networks for part of our delivery system, again without need of by hand manipulation.)

Because of the disjoint nature of our networks, and because realtime connectivity across the networks is a rare thing, we can't depend on a level 4 transport protocol like TCP to meet our end to end message handling needs, though it's useful in assuring delivery across intermediate connected segments of the networks. Nor can we use IP to route our messages because there's no dynamic route building mechanism in current implementations that can handle transient connectivity and the dynamic message addressee to destination machine address mapping we require, though we can use IP across connected segments of the networks while forwarding our messages.

But messages of the types we're considering are at a higher level of abstraction than is addressed by TCP/IP. That's where the BBS and it's Sysop have tried to fill the gap. Instead of sending and receiving packets, the BBS sends and receives whole messages. Instead of resolving packet addresses and developing dynamic packet routes, the BBS must resolve message destination address mappings, and develop dynamic message delivery routes. (SMTP is a method that does this, but it can't cope with the disjoint nature of our amateur networks.)

It's the same idea as what TCP/IP does on the packet level in semi-realtime, so we can apply many of the concepts developed for TCP/IP in our message handling systems. But there are significant differences too. Mainly because we can't expect timely end to end response, we have to alter the way we do name service resolution of addresses, and because of the disjoint store and forward nature of the network segments, we have to change the way we guarantee end to end integrity and delivery.

The one thing we can't do is allow copies of messages to be diverted to alternate delivery systems in mid-stream. Daniel gave us a way to kill duplicates at a destination machine, so having duplicates circulating inside our networks isn't a serious concern. For example we could try a flood algorithm in order to insure rapid delivery of a priority message to a destination machine. Daniel's mechanism of message hashes would kill later arriving duplicates. But if we allow the messages to be visible at intermediate machines, they can be diverted to alternate delivery mechanisms, such as voice, RTTY, or CW NTS nets. And subsequently delivered, or reinserted into the packet system in a form that defeats hash checking, or with altered routing to a different destination machine, so that they are taken and delivered again.

So my first concrete suggestion to the BBS authors is to make NTS messages invisible to potential NTS traffic takers on intermediate machines. My second concrete suggestion is that NTS messages on destination machines should auto-kill when the user who downloads it logs off the system, and an automatic service message be generated back to the originating BBS listing the call of the user taking the traffic. NTS users must be educated that if they download a piece of NTS traffic, they have then accepted responsibility for delivering that traffic.

(Note, it would be nice if there were an "oops" command so that a
mistakenly downloaded message could be re-enabled on the BBS if the
user decides before logging off that he can't handle it after all.)

Source record: 49664

>Well it's final.... Here is the latest rule from the FCC.....

<Much Deleted>

> Therefore, the Commission will hold accountable only the
>licensees of the station originating a message and the license of
>the first station forwarding a message in a high speed message
>forwarding system. The licensee of the first forwarding station
>must either authenticate the identify of the station from which it
>accepts communications on behalf of the system, or accept
>accountability for the content of the message.

<More stuff deleted>

This paragraph states that the first forwarding station must EITHER
authenticate the identity OR accept accountability.

How would this authentification be done? Here is my proposed method. I
haven't completely thought it out or solved all the little problems, but I'll
present it for discussion.

Let's say that I am a sysop for a BBS. When a packet user decides to make my
BBS his/her home BBS, I will generate a unique private key for that person.
I would send this person his private key via telephone or postal mail.

When this ham wants to send any message through my BBS, he would be required
to place an authentification string at the bottom of the message. This string
would be calculated based on the person's call sign, his private key, and
the text of the message.

My BBS software would check for this authentification string. If it was
missing or invalid, it would delete the message. If it matched, the message
would be automatically forwarded through normal channnels (without the
authentification string).

I could provide software for people using my BBS that would take their call
sign, private key, and message text and add the authentification string to the
message for them to upload. The source code for this program would be
available so it could be run on any system and so the FCC could not say we are
using cyphers or secret codes of some sort.

Would this be a good authentification? If this system was setup, I would not
have to read anyone's message before forwarding, correct?

I think one of the major problems of our current packet system is that
forwarding ham's are responsibile for other's communications. It doesn't make
since that they should be. A repeater operator isn't responsible for what a
repeater user says; the phone company isn't responsible for what is said in a

phone call, etc. etc.

Comments anyone?

970. On email addresses and host names

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-04-08 16:09:39 UTC
From: jmaynard@nyx10.cs.du.edu
Message-ID: <1994Apr8.160939.11857@mnemosyne.cs.du.edu>
Source record: 49665

Hank and Brian are having an argument over the right way to do host names and email addresses. From here, it looks like there's a fundamental disagreement over what the address _is_...

Hank, what Brian's thinking is that the email address _is_ the host name. That's the way it is on the Internet...it's user@host.domain. Even your hank@mentorg.com is nothing more than an aliased host name - there's a record (or possibly more than one, but the principle's the same) that says that mentorg.com is really some.host.mentorg.com. The sending host connects directly to the receiving host, sends the mail, and then the transaction's over. Since the Internet is fully connected, this works fine.

Brian, Hank's thinking that there are two possibilities in a store-and-forward, non-fully-connected network: Either have the email address not reflect the host name, and instead specify a hierarchical route, or else have each BBS contain a routing database - which, as was discovered early on in the Internet, is huge, inefficient, and always outdated. The DNS doesn't map well to a store-and-forward network. While the idea of a fully-connected AMPRnet is wonderful, it's a pipe dream for the foreseeable future, and we need something now. The packet BBS network isn't the Internet, and Internet solutions don't apply unchanged.

Now, can we at least talk on the same wavelength?

[Some of you (well, Hank, anyway) seem to have missed this proposal the first time around. Here it is again.]

Any hambbs-to-internet gateway which forwards mail will be required to

1) be fully registered (both A and MX records) with
the AMPR.ORG domain server.

2) be able to utilize MX records for mail exchange on the
internet.

3) be capable of accomodating a routing table large enough to
handle all the ham packet BBSs that will be routing to the
internet through it, and automatically update that table.

4) be able to generate MX records as required and submit them to
the central ampr.org database maintenance robot, either
automatically or by hand.

The procedure is:

When mail arrives from an AX.25 bbs at a ham-to-internet gateway
system, the gateway

1) updates its routing table for that BBS to reflect the routing
hints contained in the return address.
E.g., mail arriving at the WB6KDT gateway

FROM WB6XYZ@WB6CYT.#SOCA.CA.USA.NOAM

generates a routing table entry of

WB6CYT #SOCA.CA.USA.NOAM
(or whatever the gateway needs to know to reach the bbs via packet)

2) the bbs from line is rewritten* as

From: WB6XYZ@WB6CYT.AMPR.ORG

and the mail is injected into the internet

3) An MX record for WB6CYT.AMPR.ORG is established (if it does
not already exist)**, pointing to the gateway system (in this
example, WB6KDT.AMPR.ORG) with a preference value equal to the
number of stations the message took to make it to the gateway
from the bbs where it originated.

Yes, it's a bit elaborate. But it's RIGHT. It's clearly the way it
ought to be done. Let's do it.
- Brian

* Yes, rewriting addresses is supposed to be a sin. It's unavoidable
when you change addressing methods between networks, so in this case
we have to do it. I don't like that either but there's no choice.

** Yes, there's a timing problem here if a reply message is sent
before the nameserver gets updated and propagated. It's a one-time
problem, though, and could be solved by pre-registration. After all,
how many BBSs are there near each gateway system?

u
Subject: Mail Routing (was NTS traffic on packet)
To: ham-digital@ucsd.edu

OK, here's the situation as I see it. (Your milage may vary etc.)

Joe Ham in Billings Montana wants to send a message to his buddy in
Bangor Maine.

Joe would like to know several things.

1. That his message will get there intact and in a reasonable
amount of time.
2. If not, why not. (And where did it go wrong)
3. That his buddy will not get the same message every day for
the next three months.
4. Finally, that if his buddy wants to reply he can. Easily.

For what its worth, Joe Ham has the same concerns about his rusty tower
sales bulletin making it all he way out to California in the hopes that
someone with a pickup truck will drive out and pick it up locally. And
since it's Mothers Day and cards cost money, Joe Ham would like to send
an NTS message to his mom.

Now, how are we (the BBS operators who are crazy enough to want to) do this?
I suggest that we as a group switch over to the method used to deliver UUCP
mail. We have the means to have every HAM be a unique uucp site if needs be.
We can group bbses into domains if they want to or we can assign each bbs
its own domain. (Sort of the Californians dream with regard to repeaters.)
Since machines used for BBS nowadays are probably 386 or better with 200
meg drives or bigger, it shouldn't be a problem to start implimenting the
things used to move mail the same way that UUCP mail is handled.

So, the name of the host bbs would become wa6fwi.BBS for example. (BBS so as
not to get it confused with a registered UUCP name such as grendel.UUCP)
You would send mail just like the other (current) way, SP KF6PU@WA6FWI. The
big difference is NO ROUTING INFORMATION. None of the current .#soca.ca.usa
stuff. OK, so how does some BBS in Oregon (Hi Hank) know how to send mail to
wa6fwi? After all, I could be anywhere. The trick is a yellow page server to
tell Hank where to send the mail off to. The the routing table for W0RLI

would only have to make a few decisions. North, south, east, west and near or far etc. One shove and off it goes.

The YP server only has to know that wa6fwi is in Carson CA and that it talks to k6ve and wb6ymh. The sysops only have to know about their neighbors (or perhaps one or two hops away). Yeah, almost like Net/Rom eh?

Of course, for a "known route" you could always send the mail with a forced route. wa6fwi!k6ve!w8akf!ad8i@ad8i. Bang pathing. It should look familiar.

Replies are easy, by the time a message gets to its destination, a route has already been established. SR should work fine to kick it back in the direction it came from.

Errors. Errors can happen anywhere in the chain. Tracking and reporting them is the key to intellegent networking. If the message has taken a bad hop in routing, sooner or later a message is going to be generated "unknown host". If the host is truely unknown, or if it is only unknown by those around it, it should be identified as a problem. If the host is broken yet others know about it, it should generate the message "unreachable host". Finally, if the message gets delivered, the user should be known by the host system otherwise "unknown user" gets generated and sent back.

For what its worth, there shouldn't be any dupes or unknown disappearances of personal mail as a result of this method.

NTS mail gets renamed from the "old" (current) 90479@NTSCA to the "new" nts@90479. anyone loggin into a BBS should be able to read and (if needed) kill messages to nts. No, using 90479 as a host name isn't a contradiction to what I said earlier about no routing information. The name 90479 can be aliased to one or more actual bbs names depending on who is servicing the zip code. When a message is killed as delivered, an autokill message can be sent to service@90479 (same multiple destinations) to service the message. No dupes unless two people happen to download for servicing at the same time from two different bbses.

Bulletins. They get a Distribution: field. Each bbs knows where it is in the general scheme of things. If it is handed a bulletin that is within it's own area. (with reference to the distribution field) it gets published locallly. If not, it just gets passed along until it gets where it does belong. For example, sb towers@texas gets passed along (a single path) until it gets to the bbses that claim to be in texas. Then it spreads based on a locally known distribution scheme and gets published (made viewable). This also should solve a problme brought up here from time to time about "how do I send a bulletin just to new hampshire from florida without leaving a slime trail between both places?"

(Of course, we could copy the usenet news method for bulletins (er, news).)

How much needs to be known and who gets to be responsible for knowing it? Everyone should at least know who their neighbors are. At the least, all systems should be on a list somewhere. Perhaps (since we use callsigns) we could break up the list into regional lists. I know, there is an N2 station

running a bbs here in california. No problem the 2 list is back east and it lists the information for the n2 station. Even if it is out here. It would NOT be listed in the 6 list maintained out here. (in California land). And so forth. There can (and should) be a major list of the minor lists maintained as well. For example, I can find out who the list holder for w6 stations and who is the list maintainer for all the dl stations etc.

Finally, who is going to write this stuff? A lot of it is written already. It is called sendmail and runs on Unix platforms. A 386 with a 60 meg drive and 4 meg of ram can handle it. But, I might add, uucp mailers are available for Macintosh and ms-dos machines. Like most endeavors in life more is better but enough is sufficient. How do we know what to do? A lot of that is documented as well. RFC822 comes to mind. A book such as UUCP and usenet news and mail by O'Reilly and Associates is a good place to start on how to see how this works. No, I'm not suggesting that we ALL go over to running tcp/ip. (Although that's not a bad idea....) But, if we rewrite the way mail is handled in a rational manner, it can work seamlessly with tcp/ip and the internet. This as they say is a "Good thing"(tm).

How do we write the new code? Write it all in ANSI C. Link the hardware calls with assembly language modules. Make it modular. Make it public. Make it a group effort. (Sort of the way tcp/ip is being done now) Make the mailer different from the BBS, then run them both at the same time. If we do this right, (think IBM and open architecture and clones) we can have a packet mail system second to none that anyone can write applications or user interfaces for.

All it really takes is a bit of time to map out the strategy of combining the things that make amateur radio's packet BBS network as it is now with the way things are done with uucp mail in the "real world". I say "real world" not to slam the amateur aspect of what we are doing, but because that is how millions of bytes are transfered every minute of every day 7 days a week all year long.

Sure, there are a lot of items to be detailed to make this work. I see it a a goal. What about tcp/ip? Perfect. If people want a bunch of systems to run in an interactive lan type environment, fine! They can move messages in and out of the "new" system seamlessly as well. Minimum impact.

Anyways, I hope that by putting this all out in the form of a message you all have something to think about in unison. Don't think of it as reinventing the wheel, think of it as discovering that wheels work better if they are round.

From: news-mail-gateway@ucsd.edu
Subject: NTS---Hank Oredson notes
To: ham-digital@ucsd.edu

Hank, an old time friend from the Twin Cities now in "exile" in Oregon
said about the BBS/NTS interface:
>
>'But in any case, stop trying to force fit things that were appropriate
>40 or more years ago to the present reality.'
>
>...
>
> ... Hank
>

Of course Hank is right about this. The "regular" NTS, something Hank and I and many others participated in years ago, was and is a training ground to learn message handling in a format useful in emergencies and for military use.

The problem is, the telephone is so ubiquitous and so low cost, that handling messages that may or may not get delivered rates right up there with exchanging re-tries on HF packet. (STA or otherwise). That being the case we are led to the conclusion that amateur messages are probably most appropriately directed to other amateurs. The catch is, not all of the potential recipients are interested in checking into nets or checking into BBS's. For those that are "connected" in that fashion --great. But there is no real reason that we need an NTS or perhaps a VHF/HF packet linkage for emergency messages any more. The existing alternative commercial systems are generally adequate and handle dramatically more message volume per unit time than amateurs are currently able to handle. The real contribution of amateurs today seems to be 'shadowing' the managers of emergency groups and providing point-to-point communications for the disaster team. In this application the hand-held and the portable repeater and the competent net control station really shine. None of it is part of the NTS (or BBS) format.

Our hobby is evolving and the pieces of it with which we grew up are becoming less relevant. Perhaps there will be new pieces which are important in their own right. For the moment, at its simplest levels, amateur radio provides some very positive social and technical experiences that justifies its existance and continuation. There are opportunities to be part of a group, there are opportunities for personal, social and intellectual growth. Utilization of those opportunites is the provence of the individual amateur. If she or he wants to experiment with traffic -BBS of NTS type--, contests, DX, rag-chewing, vhf tropo-DX, VHF/UHF FM , or buildeing it is there to be sampled.

Forty years ago the communications world was different and the choices available and the choices made were different too! Our current culture really does not lend itself to the classic NTS format and activity and, as a result, we probably can expect it to gradually fade away.

If you have thoughts on where we may be evolving to I would very much like to hear them.

Subject: PACTOR II UPDATE
To: ham-digital@ucsd.edu

0 S~& @-#Y1~.&*jJ
> ETransfer aborted by remote R
PacTOR II update.

THE FOLLOWING TEXT CONSISTS OF TWO SEPARATE MESSAGES FROM DL2FAK TO TWO DIFFERENT HAMS IN NORTH AMERICA. THEY ARE UPDATES ON PROGRESS IN THE DEVELOPMENT OF PACTOR II.

THE FIRST IS A MESSAGE TO VE2FK IN RESPONSE TO HIS QUESTIONS TO DL2FAK. THE DATE OF THE MESSAGE IS OCT 25, 1993.

THE SECOND IS A MESSAGE TO W9UWE. THE EXACT DATE OF THE MESSAGE IS LOST, BUT IT WAS SOME TIME IN LATE SUMMER, 1993. IT IS INCLUDED HERE EVEN THOUGHT THE FIRST MESSAGE CONTAINS MORE RECENT INFORMATION BECAUSE IT DESCRIBES THE ADAPTIVE MODULATION SCHEME WHICH WILL BE USED. (de W0MFK)

HERE IS A COPY OF THE ANSWER OF TOM DL2FAK, ON MY REQUEST FOR MORE INFO ON PACTOR-II, FORWARDING, TYPE OF COMMANDS, ETC.

Hello dear Claude,

Tnx mail. Glad to hear that everybody is already looking forward to PACTOR-II. The PTC-II will of course also be capable of PACTOR-I, thus the new unit is compatible with the current PTCs. It will also provide at least one Packet Radio Port to allow PR access to the built-in mailbox. The mailbox memory will be much bigger than in the current PTC, probably up to about 200k Bytes if the 256k RAM is used. Normally the PTC-II will probably be delivered with 32k RAM, but one should also be able to order more RAM initially or change the chips afterwards. The software will automatically detect the size of the RAM.

There is of course no need to run additional PC-software for the mailbox system to be available, it will all be handled in the PTC-II itself, like in the current unit. S&F capability for Packet Radio on VHF and PACTOR on HF is not planned to be realized in the early stage, since there is already a lot of PC software available providing these features. Nevertheless, as there have to be software updates as well, we will probably build in S&F options as well. By the way, we are not going to change the syntax of the mailbox commands for several reasons. The main one is that the PTC must allow 'normal' traffic in any case. If the commands would be in the Aplink-style, you were no more able to enter sentences which are not intended to be a box command, so the two slashes are used to distinguish a mailbox command from normal QSO traffic or other commands which control additional mailbox- or terminal software (e.g. the '++'-commands which are used to operate the remote access and the binary data transfer in the latest version of our terminal software 'MT.EXE')

By the way, as the STI chip is no more available, we have a new hardware design as a successor to our 'normal' (ADC-) PTC under development. This so-called 'PTC plus' will probably be available early next year. In this unit also a 68000 CPU will be used. The command syntax will be similar to the current PTC, but there will be some more interesting features due to the increased CPU power and the bigger memory (the 'PTC plus' will also be able to carry up to 256k RAM, hence the mailbox memory can already be much bigger in this unit).

Best 73 de Tom, DL2FAK.

****

PTCLEV.II

Due to the amount of inquiries concerning the new PACTOR Level II, I will herewith provide some information on this item.

Hoever, since we are only in an early step of the development, we cannot give final information on the Level II protocol details yet. This message therefore mainly refers to a lecture, which Peter, DL6MAA, gave at the Hamvention in Dayton this year. He was talking about first results, which have been obtained using the new DSP-PTC hardware, but all this is still preliminary and subject to change in order to achieve further improvement. Despite this fact, the speach caused a lot of interest and excitment.

At present the Level II signal is planned to be basically similar to the current system, featuring 2 tones with 200 Hz. shift, using speeds of 100 or 200 baud and fitting into a 500 Hz. channel. Depending on the band conditions, the data throughput should be increased by changing the modulation forms: in bad conditions probably differential BPSK (2-PSK) with QRG diversity will be used, then D-BPSK without diversity, followed by D-QPSK (4-PSK) and finally D-QSPK at 200 baud. Thus there should be a maximum throughput

of 800 bits/second, which is already faster than CLOVER....
Besides that, in poor conditions the system will use a combination of
Memory-ARQ and error control coding. We therefore expect the minimum
required SNR to be around 7 db. lower than in the current system.

Please remember that PACTOR II and the DSP-PTC will probably not be
available on the market before next year.

On the topic of NTS messages in particular, and the use of BBS's versus
other NTS transfer modes (voice, CW or even RTTY or AMTOR between live
operators), it is then clear that the liklihood of duplicate messages
increases on packet BBS systems. I admit that if things are operating
"properly" this should not significantly increase the chance of duplicates,
but it does exist.

The definition of the word "protocol" is key here. It is not the transport mechanism per-se that causes the problem. What you are dealing with is a store and forward messaging system. In the OSI Reference Model, we're talking about a layer 7 application. So, TCP/IP versus AX.25 is totally irrelevant.

What is needed here is a positive acknowlegement handshake, perhaps somewhat more robust than is currently done. I may be able to propose a better scheme than is currently used, but would like to know how the mechanism currently works, in detail, before proposing fixes to it. What I'm looking for would be a specification (in english, not in a computer language) that documents the handoff procedure used for transferring messages between systems. As with any protocol, an accurate specification with all state transitions worked out leads to successful and reliable data transfer.

As I said above, the network and transport level protocols are not the issue here. Let's see if we can fix the application level protocol that is at issue.

>If the traffic travels by more than one path, the scheme you mention is
>not reliable. It might help, but it is another solution that provides a
>partial fix, while still allowing for duplications under "some" circumstances.

It is entirely reliable, if and only if the traffic is only allowed
to be removed at a particular destination. Deletion of the message was
specified by content only, and header information is to be ignored
by the the hash algorithm. This allows duplicates that have taken
different paths to the (one and only one allowed) destination node
to be eliminated.

The continuing problem (as I understand it from the discussions here)
is that the NTS does not require the operator taking the message off
the board (killing it) to generate a reply saying it has been received.
If the traffic has made it to the destination, there is a high probablity
that the reverse path will get the reply to the originator. This is
not a problem with the BBS system, it is a problem with the proceedures
developed by the NTS folks for passing NTS traffic through it. This
decision (no reply needed) has forced the situation where the traffic
has been considered passed when it is entered into the BBS network,
rather than the actual truth, which is that the traffic has been passed
when it is removed.

I would propose that if the NTS folks would agree to:

1) Put expiration dates in the message so that no one will deliver
a message after the timestamp.

2) Send a reply message that the message has been picked up.

3) Pick up mail for each destination area from the designated node.

3) Deliver or send the message another route if a reply is not received
by the expiration time plus some time limit.

And the BBS people would:

1) Implement the algorithm for deleting duplicate content messages that
arrive on the designated node.

Then, most of the complaints would be addressed. This still leaves
the possibility of duplicate messages being generated if:

A) The return path takes more time than the "time limit" mentioned
above.

B) The return path is blocked entirely for some reason.

These two problems are the kind of thing that the BBS operators are
probably highly willing to solve. They will not be resolved while
there are so many many variables that are out of their control causing
problems. They *cannot* be solved without some information. A
duplicate message delivered ought to be the beginning of a problem
report, not the beginning of a cussing out of the BBS network.
I'm not too sure what needs to be included, but no doubt the BBS
operators need the originating BBS, and the destination BBS, and
the problem that occured (message didn't make it [no reply] or slow
reply [reply received after duplicate generated and passed via
alternate means] or reply didn't make it [duplicate generated with
no reply received.])

It wouldn't hurt if the NTS receiving op that accepted (and killed)
a message that was past it's deadline would send a reply that it was
killed without delivery. That could be the start of a problem report
that the forward direction was too slow.

Yes, it means that a different protocol needs to be developed and
used by the NTS. The complaints being issued makes this obvious,
and the proceedures now in use seem unsuited to the medium. That's
not the BBS operators fault.

Yes, it means that the BBS operators need to do some changes to
the system software in order to make it more useful. Messages
arriving by multiple (BBS) paths are causing problems, that's not
the NTS folks fault. It would also seems that they could use
a couple of features like zip-code to BBS node mappings, and
auto reply with something like "accepted for delivery" and
"killed, past expiration" responses. It's not my place to decide
the needs, that falls on the NTS.

Yes, I've gone on this diatribe far too long. I see a lot of
people trying to do good here, maybe this kick in the rear will
have helped. It at least represents a fresh viewpoint, as I
don't participate on either side of the fence here. I'll shut
up now. Thanks for everyone's patience.

973. Re: Mail Routing (was NTS traffic on packet)

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-04-08 18:30:10 UTC
From: lawrence@combdyn.com
Message-ID: <1994Apr8.183010.22784@combdyn.com>
Source record: 49668

In article <765694829snx@skyld.grendel.com> jangus@skyld.grendel.com (Jeffrey D. Angus) writes:
> Now, how are we (the BBS operators who are crazy enough to want to) do this?
> I suggest that we as a group switch over to the method used to deliver UUCP
> mail. We have the means to have every HAM be a unique uucp site if needs be.

We already have unique names.....everybody's callsign is unique. And they are issued geographically, so VE* and VA* is Canada....later say VE6* is Alberta.

> We can group bbses into domains if they want to or we can assign each bbs
> its own domain. (Sort of the Californians dream with regard to repeaters.)

That's kind of what hierarhial address tries to do.....except it was before Internet adopted 2letter country codes.

Why don't we scrap the country and continent codes we have now, and use the Internet country codes only....and an additional one after that to say the world of Amateur Radio...incase it crosses out of Packet land.

The US and CA domain committees also have ways to further break down their domains into provinces/states and cities, etc.

My machine at home is 'lhaven.uumh.ab.ca'.

'lhaven' is the machine name,
'uumh' is the organization abbrevation,
'ab' is for Alberta
'ca' is for Canada.

If uumh wasn't serving a larger area than Medicine Hat....there would be a 'MedicineHat', between 'uumh' and 'ab'.

For Packet we move the organization part to the end, and some body may define a '#' field for their province/state/region...

So, my BBS could be:

VE6PAQ.#MHT.AB.CA

AMPR.ORG might be the organization suffix to use, it may not be.....

The Internet MX would have traps for countries and optionally states to figure out how to route....or it not.

> Since machines used for BBS nowadays are probably 386 or better with 200
> meg drives or bigger, it shouldn't be a problem to start implimenting the
> things used to move mail the same way that UUCP mail is handled.

We do this now already.....

My UUCP site looks at the address. If its *.ca or *.uucp it sends it to
'uunet.ca', if its *.rain.com it sends it 'dialup', if its '.combdyn.com'
it goes to 'combdyn'. If its '.uumh.ab.ca', it sees if its directly connected
or it tosses it because its not a valid member of the domain. Everything else
goes to 'portal'.....the machines down stream have to figure out where to go
next if it wasn't for them.

My Packet system is configured in a similiar manner already....except that
I don't know what all the different suffixes are....so a few sites just have
'*' for them....to catch any suffix that I don't know about.

> The YP server only has to know that wa6fwi is in Carson CA and that it talks
> to k6ve and wb6ymh. The sysops only have to know about their neighbors (or
> perhaps one or two hops away). Yeah, almost like Net/Rom eh?
>
you mean setup something like pathalias...and have the BBSs support pathlines.

You could do that, but its got problems......

You might specify ve6yyc!ve3???!ve4???!ve5???!ve6paq because you saw a
message take this route to get to me, but there might be only a oneway
forwarding connection in there, its not going to reverse. We'll ignore
the fact that ve6paq is supposed to be able to connect directly to ve6yyc....
but it can't right now.

Also path information would involve huge bulletins flying over packet land
(ala comp.mail.maps)....which would serve to slow things down....which is why
its recommended that UUCP sites get domain names.

Also the path is a dynamically changing thing.....one day I can send a message
directly up to VE6YYC from VE6PAQ....but today I couldn't get a message by
packet to there even if my life depended on it.

So, your suggesting we de-evolve Amateur Radio?

> For what its worth, there shouldn't be any dupes or unknown disappearances of
> personal mail as a result of this method.
>
UUCP doesn't get dupes...because if you receive one message, you only send
out one message. Not like some packet networks that have redundant loops
incase one route is down.

USENET uses Message-IDs to determine if a message has arrived already or not,
and it uses the path line to decided if it should pass it on to a downstream
site.....Packet already does both of these.

> NTS mail gets renamed from the "old" (current) 90479@NTSCA to the "new"

> No dupes unless two people happen to download for servicing at the same time
> from two different bbses.
>
> Bulletins. They get a Distribution: field. Each bbs knows where it is in the

The @BBS field of a Bulletin is already the Distribution: field....you just need a mechanism to pass a bulletin through to other regions....which doesn't work on USENET anyways. Except that most systems don't observe Distribution:

I was receiving can.* groups from a US site with "Distribution: can"....just as well as I'm now from a Canadian site.

>
Yeah, you'd have to do a lot of convincing to get the whole world to drop what they have now and run new software.

As for how TCP/IP works, mail/news is transport independant.....you could probably adapt the method used now to do it. SMTP and NNTP would probably work just fine over packet, there's nothing that says the commands and data have to be sent in IP packets.

: At least G-TOR only upshifts to 300-baud when it has enough data to
: justify it. It doesn't take up the wider bandwidth unless it needs to.
: I don't see anything wrong with taking up bandwidth as long as you're
: not wasting it.

Well, there are two problems. The first is that many radios have as
their available filter selections 2.1 kHz (or so) and 500 Hz. A
300-baud, 200-Hz-shift signal really needs a wider filter than 500 Hz.
So 300-baud operators (like existing HF packet ops) tend to use their
SSB filters. Then they can't tolerate interference on adjacent channels
because the interfering signals fall within their filter passbands, so
they space out to 2-kHz separation. In this case, these stations *are*
effectively taking up bandwidth that they aren't really using.

The second problem is that in an environment in which signals are not
subbanded (if that's a word) by transmission mode, the use of signals
of different widths make sharing the spectrum more difficult.

|> "Baycom type modems". I am also looking for a software TNC program, WA8DED.

As far as I know, GP runs directly on TNCs unter Host-Mode (this is TheFirmware,
sometimes called WA8DED). If you are using Baycom Modem, you need a special
driver (I think it is called TFPCX) which must be run before GP to emulate a
normal TNC under Hostmode.

|> It is my understanding that this program is needed before this program will
|> function. If anyone knows where I can get a copy of WA8DED software, please
|> reply.

GP will not run with TNCs using TAPR. It will only run with TNCs using
TheFirmware. It will run with Baycom-Modem only, if you run the emulator.
If you do not use Baycom, just switch your TNC in TheFirmware-mode and GP will be
happy.

PS: As far as I know, GP requires an AT with VGA and mouse.

In my previous message, the private key authenticates the source station (in my opinion). Only the BBS and the source station know their private key. The private key is never sent via ham radio. It is kind of like a password. That is my form of authentication. This is one more "grey area" in the FCC rules.

Now I'm confused. How are these routes fixed? What happens when a
forwarding partner goes off air? What happens when a node goes down?
How are backup routes handled? I see "fixed routes" on a hour to hour
basis, but not on a year to year basis. Often, not even on a week to week basis.

Well ... the bbs authors don't care much - this is just data transport.
Bytes get from point A to pont B, not important how they get there.
i.e. it has nothing to do with the bbs protocol.

|> Maybe the answer is to make the 219 MHz DASH a tcp/ip network and put the

That is what we already do, but with other protocols: AX.25, NET/ROM,
CLOVER, AMTOR, PACTOR, whatever. tcp/ip as tranport protocol has not made
much inroad in the bbs network, for various reasons. It really does not
matter what transport protocol is used, the bbs system does not care.

|> realize that I will be reading at 1200 for quite some time ... maybe 9600
|> if the bbs operators will provide this service.

Yes, much traffic analysis. The bulk of message traffic is "many hop".
At each increase in network capability to date, traffic has increased to
saturate the new capability within a short time. I already have users at
9600 baud, and they are asking for faster response ...

At least in the PNW, traffic has been running roughly equal volume (in bytes) between personal and bulletins, with twice as many personal messages as bulletins flowing through the system.

One thing to think about though: we have two different services represented by the existing bbs network. There are single sender to single recipient messages (e.g. personal messages) and also single sender to multiple recipient messages (e.g. bulletins). We now tend to handle these messages types a little differently - mostly by giving some priority to the personal messages. Whatever transport mechanism we use will make little difference to the day to day operation of a bbs system though - the messages will come in, they will go out, users will send and read them.

Well, the only problem I see is that any station that can monitor
the packet frequency can obtain the authentication string and then
forge messages with that callsign.

979. Unidentified Mystery RTTY(ARQ/FEC) Sigs

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-04-09 00:39:29 UTC
From: jnavary@nyx10.cs.du.edu
Message-ID: <1994Apr9.003929.8930@mnemosyne.cs.du.edu>
Source record: 49672
Cross-posted to: rec.radio.shortwave,rec.radio.amateur.digital.misc

The following text was copied on 8901.7 kHz (carrier freq)
FEC at 2300 UTC on 8 April 94. Prior to the FEC transmission,
for at least 5 minutes the station transmitted a "marker" type
signal (although different than that typical of maritime
stations). The "marker" or perhaps a call-up signal consisted
of the shorter ARQ signal typical of the acknowlegement
transmission of an ARQ station that is receiving text. After
a few seconds of this, the mark and space tones would be
transmitted, alternating a few times. There would then be
a short break, followed by a repetition of the whole thing.

At exactly 2300 they kicked in with FEC mode and I copied the
following:

TFWGS PS YS KF TFWGS PS YS KF TFWGS PS YS KF TFWGS TFWGS TFWGS

TFWGS PS YS KF TFWGS PS YS KF TFWGS KPJOWJ KPJOWJ KPJOWJ KPJOWJ

RKUKGK HTSKHGK TFWGS JG UXDWJ TFWGS TFWGS TFWGS HUXD HUXD

Anyone have any ideas what this might be? It's smack-dab in
the Aeronautical Service band but probably not an Aeradio
station.

RDS is a system used in Europe where radio stations can
send digital information over FM subcarriers. This way
they can send the radio station call-letters,
and in many cases traffic problems. Can anybody pleas
let me know if there is any software that can parse messages
out of the RDS protocol?

Thanks.

Subject: Baypac and other software programs
To: ham-digital@ucsd.edu

Has anyone had any luck with using programs such as Super Packet or Mubay
with the Tigertronics Baypac modem. These programs use the TFPCX driver.
It appears that the programs will send packets, but will not receive them
reliably. The Baypac also appears that it will not work with the Baycom
1.5 software. Also, we are considering using the APRS software around
here for weather reporting. Has anyone had any luck getting APRS to talk
to the Baypac ? I did notice that JVFAX seems to accept information from
the Baypac when the comparator interface is selected. Does this program
work with the Baypac ?

Thanks

BJARTS@stthomas.EDU wrote:
: THE FOLLOWING TEXT WAS PICKED UP FROM THE DL2FAK PACTOR MBX IN GERMANY
: BY VE2FK IN MONTREAL. IT WAS WRITTEN BY DL2FAK, ONE OF THE DEVELOPERS
: OF PACTOR.
:
: G-TOR - An Improvement?
:
[]
: The Golay encoding however, as used in the G-TOR mode, is only able to correct
: 3 bits in a block of 24 bits and only half of this block (12 bits) carries in-
: formation. The remaining 12 bits have to contain the required redundancy, and
: no new data. It is therefore only possible to correct a few errors despite the
: large overhead. For this reason the Golay encoding would only be useful for
: errors caused by short spikes on the higher short wave frequencies (10 to
20m).
: You cannot however expect it to provide any improvements in typical 80m con-
: ditions. Here it is necessary not only to use hybrid-2 ARQ systems, but also
: suitable, powerful (invertible) codes, which allow the reconstruction of the
: original information, even when only the redundancy block is received, rather
: than Golay or similar simple block coding, which always requires both blocks
: to be received to get the data transferred.

My understanding is that G-TOR uses an extended Golay (24,12) code that
is, in fact, invertible. What G-TOR does is to send the data block,
then if and only if an error occurred, it sends the Golay "parity" bits
as a block. The receiving station can derive the data from either of
these blocks if the block is correctly received. If it is not, the
receiver can pass the two received blocks into the Golay decoder for an

attempt at error correction. This, I suspect, is a substantially more
powerful scheme than memory ARQ, although I don't have good data on
hand to back that up.

: The most robust HF (short wave), narrow band, data transmission systems known,
: apply very powerful convolutional codes with Viterbi decoding and soft deci-
: sion (requiring an ADC/DSP just like analog Memory-ARQ). The processing speed
: of those systems exceeds the capability of a KAM by factor 100. Despite this
: very expensive approach, they only achieve around 10 dB better weak signal
: performance than PACTOR-1. The closer a system approaches the Shannon boundary
: (theoretical throughput limit) the more difficult it gets to gain another one
: or two decibels.

Perhaps, but 10-dB better in what environment? AWGN? That's not the
environment of interest at HF. If the 10 dB figure is for a real-world
environment, I'd be interested to see the reference it's from.

: W0XI et al claim that they were able to transfer a certain file on the 20m
: band in about 5 minutes using G-TOR, whereas PACTOR, which was used
afterwards,
: took about 20 minutes. The conclusion was that G-TOR would be about 4 times
: faster than PACTOR in general, which is actually impossible!! According to the
: system description, G-TOR can on average only be about 1.5 times faster than
: PACTOR.

Impossible? Not if G-TOR is correcting errors using fewer
retransmissions than Pactor requires.

[]
: Regardless of the Huffman data compression, which improves the throughput of
: both systems in the same way, the comparison of throughput between PACTOR and
: G-TOR can be easily calculated. According to the protocol description pub-
: lished by W0XI, G-TOR is able to transfer a maximum of 19 characters per se-
: cond when running on 200 baud (They claim 69 data bytes in a cycle duration of
: 2.4 seconds at 300 baud, which means maximum 2/3*69/2.4 characters per second
: at 200 baud). The maximum rate of PACTOR at the same speed is 16 chrs/s, which
: is a relationship of 1.18 to 1. The Golay encoding is not able to improve the
: throughput so dramatically that you finally result in a factor 4. It must be
: remembered that the analog Memory-ARQ, as used in the original PACTOR imple-
: mentation, is able to improve the effective signal-noise ratio with each ag-
: gregated packet and hence enables a higher throughput (especially in weak con-
: ditions) than the Golay coding gain. It is therefore obvious that the higher
: maximum throughput of G-TOR is mainly based on its higher maximum baudrate.
: This however means, it has to exceed the usual 500 Hz band width limit.

Again, this discussion neglects to consider the error-correcting
capabilities of G-TOR. (It would be interesting, though, to add
memory ARQ to G-TOR, particularly with soft decisions.)

: With this in mind it must also be remembered that a wider receiver bandwidth
: receives more noise. A 300 baud G-TOR signal will therefore have a poorer S/N
: ratio than a 200 baud PACTOR signal (if they are both of the same

fieldstrength
: and the receiver bandwidth is correctly adjusted for both modes). As signals
: decrease, G-TOR would have to switch to 200 baud before the PACTOR signal
: would be affected, thus further reducing some of the proposed speed gain.

This is true. it might have been better had G-TOR stuck to a 200-baud
upper limit. We have enough wide-bandwidth signals on the bands now.

: There are still some more disadvantages of G-TOR in comparison to PACTOR, e.g.
: the cycle duration is quite long at 2.4 seconds, and will increase to almost 5
: seconds when using the Golay encoding, hence leading to quite long break-in
: times. The speed adaptation times are necessarily also longer, thus leading to
: poorer results in rapidly changing conditions (multipath).

No, the cycle time is not affected by the encoding because of the
alternate-block transmission scheme I mentioned earlier. 2.4 s is the
actual G-TOR cycle time.

: Furthermore, the interleaving and the 3 different baud rates used in G-TOR
will
: probably lead to a lot of problems with the listen mode, an important point
for
: all digital modes used in Amateur Radio.

Possibly. Kantronics has a monitoring program for the PC. I've not
yet seen it in use yet, but we have a copy in-house here.

: Actually G-TOR is just a modified PACTOR system, which probably does not pro-
: vide enough improvement that introducing this mode as another new standard
: would be worth-while. With regard to the basic requirements of each digital
: data transfer mode (like throughput, bandwidth, error rate, etc.) PACTOR al-
: ready represents nearly the optimum attributes that are obtainable with an FSK
: system. A real improvement over the current PACTOR system can only be reached
: when using different modulation schemes like PSK, which require a DSP
hardware.

I'd say it's substantially more than a modified Pactor system! It uses
different timing, different coding and a vastly different
error-correction system. You might as well say Pactor is a modified
AX.25!

: This step will be done this year with the introduction of PACTOR Level-II.

It will be most interesting to see G-TOR and Pactor-II go head-to-head!
May the best protocol win.

At least G-TOR only upshifts to 300-baud when it has enough data to
justify it. It doesn't take up the wider bandwidth unless it needs to.
I don't see anything wrong with taking up bandwidth as long as you're
not wasting it.

Subject: TCP/IP from car w/PK-88 (Help)
To: ham-digital@ucsd.edu

I have just recently purchased a laptop, and since I have a PK-88 here
I have not used for a year or so, already have a 50w VHF radio in the car
that doesn't get much use (I'm a UHF nut), and I already have a TCP/IP
address allocated to me, I would like to use TCP/IP from the car.

I understand that TCP/IP is not designed for moving stations, and that
it wont work well if I am moving. My question to everyone is mainly what
flavor of NOS or KA9Q should I use for a laptop and a PK-88 ?

I realize this question is almost like asking what is the best car to buy..
I expect many different answers-- and thats ok.

Thanks,
Andrew (N9KET)

Subject: What modulation is used today?
To: ham-digital@ucsd.edu

Hello all,

I'd like to play around with making a multi-mode black box that
can decode and encode all of the digital amateur radio modes out
there today. Basically a homebrew TNC I guess. At any rate, can
anyone tell me what modulation schemes and tone pairs are used for
the following modes? I'd like to know what modem chip I need and
what modes to program it to use.

For example: 1200 baud packet: AFSK - Bell 202 tones.

9600 baud (and faster) VHF/UHF packet:

HF packet:

RTTY:

Amtor:

WeFax:

Pactor:

SSTV:

Any others?:

And does anyone have any chip recommendations?

I must have missed this somewhere, possibly in an otherwise uninteresting
thread. What is this 219 Mhz DASH? Never heard of it.

Transport BBS traffic via tcp/ip? No objection here.

I would ALSO like to see more discussion on ANY new network.
But, let's make it a coordinatoed effort, with wide support, not
something that one little niche does and has to kluge an interface to
their neighbors for.

So tell me, what is this DASH thing?

Gary

You might investigate the SR command ... "Send Reply" ...

We are talking about humans picking up and delivering messages that were entered into the system by other humans. A simple reply message stating "I took your number xxxx and delivered it" is awfully simple.

Automating the process is of course possible, but gives no information on whether the person who took ("Killed", in BBS terms) the message actually DID deliver it.

In the olden days, there was an automatic response to the act of killing an NTS message at a BBS. The ARRL came to the conclusion this was not very useful, as it did not convey the required information "I delivered it".

So there are several different levels or types of confirmation that might be provided. If messages are getting "lost" then the NTS folks involved might as the sysop to check and find out what happened. This is a normal BBS sysop function; verifying that links actually work, that messages actually move to their destinations. BBS systems keep track of each message; who forwarded it to me when, who did I forward it to when. Following this audit trail is not at all difficult - we do it all the time to discover and repair problems in the network.

Anything is possible - "It's just a Small Matter Of Programming".

Once NTS (or ARRL or ?) formulates a plan and submits it to the BBS authors, expect to see things happen very quickly.

To date, no plan, thus no action.

... Hank

>is the new kid on the block and potentially the next generation!!

Ted,

We've been using WNOS4 for some time at GB7SIG and had no problems until
we had a sudden increase in user activity. When the mail activity got
large WNOS could not cope. We tried the beta version of WNOS5 but this
seems to suffer from the same problem.

We are now trying to set up JNOS but are having lots!!! of trouble. Short
answer is, if its for your own BBS then WNOS4 is great. JNOS needs more work
to get the setup right. I have JNOS working at home but there seems to be
a problem with memory. The mailer does not work at present, probably because
of the lack of memory so watch this space.

I look forward to your comments and perhaps info from other areas.

Best regards & 73's

Duncan R Goodacre G7EXG

Try looking at the 'eol' command on KA9Q. I think there is some trickery
involved to switch from the DOS newline to the Unix newline convention
(similar to transferring ASCII files via ftp) which might even be done with
some negotiation when opening the telnet connection. Possibly some flavours
of software do it better than others?

As much as I would like to see amateur radio continue to provide useful
message handling systems for emergencies, Mr. Olson is right, our methods
and modes are obsolete in the modern world, except in very rare and limited
cases. If we are to be of help in this arena, and I think we still can be,
then we have to rethink our approach.

For those of us interested in digital modes, the challenge is to seamlessly
internetwork with the "information superhighway". The NTS message format
is not compatable with that goal because it was intended to be handled
with human interpretation and human intervention. We need to re-examine
the way we handle messages, and the format in which they are cast.

Key areas we need to examine are format, addressing, routing, and assured
delivery. RFC822 or X400 messaging standards give us frameworks for messages
that can transparently move over many disjoint networks. The ticklish problems
we face are in resolving a message addressee to a machine address, and in

dynamically building routing systems that can deal with our often transient systems and links. (We should be able to act as bridges across broken commercial links in time of emergency without having to handle messages by hand, and we should be able to utilize commerical networks for part of our delivery system, again without need of by hand manipulation.)

Because of the disjoint nature of our networks, and because realtime connectivity across the networks is a rare thing, we can't depend on a level 4 transport protocol like TCP to meet our end to end message handling needs, though it's useful in assuring delivery across intermediate connected segments of the networks. Nor can we use IP to route our messages because there's no dynamic route building mechanism in current implementations that can handle transient connectivity and the dynamic message addressee to destination machine address mapping we require, though we can use IP across connected segments of the networks while forwarding our messages.

But messages of the types we're considering are at a higher level of abstraction than is addressed by TCP/IP. That's where the BBS and it's Sysop have tried to fill the gap. Instead of sending and receiving packets, the BBS sends and receives whole messages. Instead of resolving packet addresses and developing dynamic packet routes, the BBS must resolve message destination address mappings, and develop dynamic message delivery routes. (SMTP is a method that does this, but it can't cope with the disjoint nature of our amateur networks.)

It's the same idea as what TCP/IP does on the packet level in semi-realtime, so we can apply many of the concepts developed for TCP/IP in our message handling systems. But there are significant differences too. Mainly because we can't expect timely end to end response, we have to alter the way we do name service resolution of addresses, and because of the disjoint store and forward nature of the network segments, we have to change the way we guarantee end to end integrity and delivery.

The one thing we can't do is allow copies of messages to be diverted to alternate delivery systems in mid-stream. Daniel gave us a way to kill duplicates at a destination machine, so having duplicates circulating inside our networks isn't a serious concern. For example we could try a flood algorithm in order to insure rapid delivery of a priority message to a destination machine. Daniel's mechanism of message hashes would kill later arriving duplicates. But if we allow the messages to be visible at intermediate machines, they can be diverted to alternate delivery mechanisms, such as voice, RTTY, or CW NTS nets. And subsequently delivered, or reinserted into the packet system in a form that defeats hash checking, or with altered routing to a different destination machine, so that they are taken and delivered again.

So my first concrete suggestion to the BBS authors is to make NTS messages invisible to potential NTS traffic takers on intermediate machines. My second concrete suggestion is that NTS messages on destination machines should auto-kill when the user who downloads it logs off the system, and an automatic service message be generated back to the originating BBS listing the call of the user taking the traffic.

NTS users must be educated that if they download a piece of NTS traffic,
they have then accepted responsibility for delivering that traffic.
(Note, it would be nice if there were an "oops" command so that a
mistakenly downloaded message could be re-enabled on the BBS if the
user decides before logging off that he can't handle it after all.)

Yes, RTTY is usually FSK or AFSK. The common frequency shifts are
170 Hz (current) and 850 Hz (somewhat obsolete). It uses a 5 bit
Baudot code, the details of which are in most ARRL handbooks. As a
matter of fact, you would do well to pick up a copy and see what's
in there on the subject; at least the older books had a good
description. 73 DE K6DDX

Yes, I would exactly like to do that, automatically from NOS. Send the
fbb bbs a message with the from BBS that has the same address as that fbb
BBS. Example: I'm a NOS user, so I would be declared hb9vbc @ hb9vbc.ampr.org
I also use an AX25 BBS called hb9iap.srom.che.eu, so I would like to smtp
the ax25 bbs and tell NOS to use instead of the form sp xxx < hb9vbc @ hb9vbc
the form : sp xxx < hb9vbc @ hb9iap. Is this possible ???

That was me.... I have the source, I even have a DR200 but trying to get hold
of a Z80 C compiler which will do the necessary tricks for overlays etc to get
the code to fit is not proving quite so easy. I daresay if I spent enough
money I could get a commercial offering capable of doing it but it would be
a lot of money for a one-off project. I did try the public-domain Hitech C
(running under a CP/M emulator on my PC) but that won't do the necessary
tricks. I haven't found a decent Z80 cross-compiler for the PC yet so I am
open to suggestions.

Sounds to me like some NTS folks need to talk to the BBS sysops involved,
and give them some guidelines on how NTS would like it's traffic handled
within the BBS network. I would expect NTS to contact me (as well as the
other BBS authors) about these issues; they have not done so.

|> The skepticism on the part of many NTS operators comes from the need to
|> trust a distributed system of unknown (at the moment of sending) reliability
|> to get the message through.

Have there been major problems? Does the NTS liason who takes the message
and delivers it notify the NYS liason who put it into the BBS network? If
they do, what sorts of problems are seen?

At least in this area of the country, I hear a lot of whining from the NTS
folks, but when I look at my own BBS system I see *all* NTS traffic
clearing within 24 hours - to any part of the US and CANADA. The only
traffic that remains "stuck" is traffic destined to my local area.
Sometimes no NTS liason checks the BBS for several days.

|> I use packet nearly every day to communicate with folks, but often will
|> ask when on a voice mode if they got the message or not.
|>

Why not ask on packet?
The SR command is not really all that hard to type.

|> As noted above, it is not "temptation" that causes trouble. If an
intermediate
|> BBS allows a user to list the traffic, and to KILL the traffic, then that
|> user has assumed responsibility for the message. It does not matter if the
|> message gets to the "right" BBS near the destination zip code, just so long
|> as SOMEONE is able to pick it up, and kill it, and have that ONLY HAPPEN
|> ONCE!

And if there is any doubt about who took the traffic from the BBS system,
the BBS log files can confirm who took it, when they took it, etc.

If NTS wants confirmation of the point of exit from the BBS system, a
simple SR and message with "I took your number xxx" is all that is
required.

... Hank

988. TAPR File server

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-04-09 18:29:49 UTC
From: w6swe@w6swe.tapr.ORG
Message-ID: <549@w6swe.tapr.org>
Source record: 49682

It looks like I goofed in a message I sent out the other day. The file server at TAPR can be reached at the address file-request@tapr.org. To get the help file and a list of available files, send a message to

file-request@tapr.org

In the body of the message, type the lines:

help
dir
quit

The information will be sent to you. A reply-to line in your header will help in cases where the return information is hard to decipher.

The address given previously, tapr@tapr.org goes to a human who will be glad to take your orders or process membership applications, etc., but cannot send you the requested files. This can only be done by the file robot.

>Well it's final.... Here is the latest rule from the FCC.....

<Much Deleted>

> Therefore, the Commission will hold accountable only the
>licensees of the station originating a message and the license of
>the first station forwarding a message in a high speed message
>forwarding system. The licensee of the first forwarding station
>must either authenticate the identify of the station from which it
>accepts communications on behalf of the system, or accept
>accountability for the content of the message.

<More stuff deleted>

This paragraph states that the first forwarding station must EITHER
authenticate the identity OR accept accountability.

How would this authentification be done? Here is my proposed method. I
haven't completely thought it out or solved all the little problems, but I'll
present it for discussion.

Let's say that I am a sysop for a BBS. When a packet user decides to make my
BBS his/her home BBS, I will generate a unique private key for that person.
I would send this person his private key via telephone or postal mail.

When this ham wants to send any message through my BBS, he would be required
to place an authentification string at the bottom of the message. This string
would be calculated based on the person's call sign, his private key, and
the text of the message.

My BBS software would check for this authentification string. If it was
missing or invalid, it would delete the message. If it matched, the message
would be automatically forwarded through normal channnels (without the
authentification string).

I could provide software for people using my BBS that would take their call
sign, private key, and message text and add the authentification string to the
message for them to upload. The source code for this program would be
available so it could be run on any system and so the FCC could not say we are
using cyphers or secret codes of some sort.

Would this be a good authentification? If this system was setup, I would not
have to read anyone's message before forwarding, correct?

I think one of the major problems of our current packet system is that forwarding ham's are responsibile for other's communications. It doesn't make since that they should be. A repeater operator isn't responsible for what a repeater user says; the phone company isn't responsible for what is said in a phone call, etc. etc.

Comments anyone?

In my previous message, the private key authenticates the source station (in my opinion). Only the BBS and the source station know their private key. The private key is never sent via ham radio. It is kind of like a password. That is my form of authentication. This is one more "grey area" in the FCC rules.

Well, the only problem I see is that any station that can monitor
the packet frequency can obtain the authentication string and then
forge messages with that callsign.

|> "Baycom type modems". I am also looking for a software TNC program, WA8DED.

As far as I know, GP runs directly on TNCs unter Host-Mode (this is TheFirmware,
sometimes called WA8DED). If you are using Baycom Modem, you need a special
driver (I think it is called TFPCX) which must be run before GP to emulate a
normal TNC under Hostmode.

|> It is my understanding that this program is needed before this program will
|> function. If anyone knows where I can get a copy of WA8DED software, please
|> reply.

GP will not run with TNCs using TAPR. It will only run with TNCs using
TheFirmware. It will run with Baycom-Modem only, if you run the emulator.
If you do not use Baycom, just switch your TNC in TheFirmware-mode and GP will
be
happy.

PS: As far as I know, GP requires an AT with VGA and mouse.

To: ham-digital@ucsd.edu

Try looking at the 'eol' command on KA9Q. I think there is some trickery
involved to switch from the DOS newline to the Unix newline convention
(similar to transferring ASCII files via ftp) which might even be done with
some negotiation when opening the telnet connection. Possibly some flavours
of software do it better than others?

>to hear them.

As much as I would like to see amateur radio continue to provide useful
message handling systems for emergencies, Mr. Olson is right, our methods
and modes are obsolete in the modern world, except in very rare and limited
cases. If we are to be of help in this arena, and I think we still can be,
then we have to rethink our approach.

For those of us interested in digital modes, the challenge is to seamlessly
internetwork with the "information superhighway". The NTS message format
is not compatable with that goal because it was intended to be handled
with human interpretation and human intervention. We need to re-examine
the way we handle messages, and the format in which they are cast.

Key areas we need to examine are format, addressing, routing, and assured
delivery. RFC822 or X400 messaging standards give us frameworks for messages
that can transparently move over many disjoint networks. The ticklish problems
we face are in resolving a message addressee to a machine address, and in
dynamically building routing systems that can deal with our often transient
systems and links. (We should be able to act as bridges across broken
commercial links in time of emergency without having to handle messages
by hand, and we should be able to utilize commerical networks for part
of our delivery system, again without need of by hand manipulation.)

Because of the disjoint nature of our networks, and because realtime
connectivity across the networks is a rare thing, we can't depend on a
level 4 transport protocol like TCP to meet our end to end message handling

needs, though it's useful in assuring delivery across intermediate connected segments of the networks. Nor can we use IP to route our messages because there's no dynamic route building mechanism in current implementations that can handle transient connectivity and the dynamic message addressee to destination machine address mapping we require, though we can use IP across connected segments of the networks while forwarding our messages.

But messages of the types we're considering are at a higher level of abstraction than is addressed by TCP/IP. That's where the BBS and it's Sysop have tried to fill the gap. Instead of sending and receiving packets, the BBS sends and receives whole messages. Instead of resolving packet addresses and developing dynamic packet routes, the BBS must resolve message destination address mappings, and develop dynamic message delivery routes. (SMTP is a method that does this, but it can't cope with the disjoint nature of our amateur networks.)

It's the same idea as what TCP/IP does on the packet level in semi-realtime, so we can apply many of the concepts developed for TCP/IP in our message handling systems. But there are significant differences too. Mainly because we can't expect timely end to end response, we have to alter the way we do name service resolution of addresses, and because of the disjoint store and forward nature of the network segments, we have to change the way we guarantee end to end integrity and delivery.

The one thing we can't do is allow copies of messages to be diverted to alternate delivery systems in mid-stream. Daniel gave us a way to kill duplicates at a destination machine, so having duplicates circulating inside our networks isn't a serious concern. For example we could try a flood algorithm in order to insure rapid delivery of a priority message to a destination machine. Daniel's mechanism of message hashes would kill later arriving duplicates. But if we allow the messages to be visible at intermediate machines, they can be diverted to alternate delivery mechanisms, such as voice, RTTY, or CW NTS nets. And subsequently delivered, or reinserted into the packet system in a form that defeats hash checking, or with altered routing to a different destination machine, so that they are taken and delivered again.

So my first concrete suggestion to the BBS authors is to make NTS messages invisible to potential NTS traffic takers on intermediate machines. My second concrete suggestion is that NTS messages on destination machines should auto-kill when the user who downloads it logs off the system, and an automatic service message be generated back to the originating BBS listing the call of the user taking the traffic. NTS users must be educated that if they download a piece of NTS traffic, they have then accepted responsibility for delivering that traffic. (Note, it would be nice if there were an "oops" command so that a mistakenly downloaded message could be re-enabled on the BBS if the user decides before logging off that he can't handle it after all.)

Yes, RTTY is usually FSK or AFSK. The common frequency shifts are
170 Hz (current) and 850 Hz (somewhat obsolete). It uses a 5 bit
Baudot code, the details of which are in most ARRL handbooks. As a
matter of fact, you would do well to pick up a copy and see what's
in there on the subject; at least the older books had a good
description. 73 DE K6DDX

Yes, I would exactly like to do that, automatically from NOS. Send the
fbb bbs a message with the from BBS that has the same address as that fbb
BBS. Example: I'm a NOS user, so I would be declared hb9vbc @ hb9vbc.ampr.org
I also use an AX25 BBS called hb9iap.srom.che.eu, so I would like to smtp
the ax25 bbs and tell NOS to use instead of the form sp xxx < hb9vbc @ hb9vbc
the form : sp xxx < hb9vbc @ hb9iap. Is this possible ???

That was me.... I have the source, I even have a DR200 but trying to get hold
of a Z80 C compiler which will do the necessary tricks for overlays etc to get
the code to fit is not proving quite so easy. I daresay if I spent enough
money I could get a commercial offering capable of doing it but it would be
a lot of money for a one-off project. I did try the public-domain Hitech C

(running under a CP/M emulator on my PC) but that won't do the necessary
tricks. I haven't found a decent Z80 cross-compiler for the PC yet so I am
open to suggestions.

Sounds to me like some NTS folks need to talk to the BBS sysops involved,
and give them some guidelines on how NTS would like it's traffic handled
within the BBS network. I would expect NTS to contact me (as well as the
other BBS authors) about these issues; they have not done so.

|> The skepticism on the part of many NTS operators comes from the need to
|> trust a distributed system of unknown (at the moment of sending) reliability
|> to get the message through.

Have there been major problems? Does the NTS liason who takes the message and delivers it notify the NYS liason who put it into the BBS network? If they do, what sorts of problems are seen?

At least in this area of the country, I hear a lot of whining from the NTS folks, but when I look at my own BBS system I see *all* NTS traffic clearing within 24 hours - to any part of the US and CANADA. The only traffic that remains "stuck" is traffic destined to my local area. Sometimes no NTS liason checks the BBS for several days.

|> I use packet nearly every day to communicate with folks, but often will
|> ask when on a voice mode if they got the message or not.
|>

Why not ask on packet?
The SR command is not really all that hard to type.

|> As noted above, it is not "temptation" that causes trouble. If an
intermediate
|> BBS allows a user to list the traffic, and to KILL the traffic, then that
|> user has assumed responsibility for the message. It does not matter if the
|> message gets to the "right" BBS near the destination zip code, just so long
|> as SOMEONE is able to pick it up, and kill it, and have that ONLY HAPPEN
|> ONCE!

And if there is any doubt about who took the traffic from the BBS system, the BBS log files can confirm who took it, when they took it, etc.

If NTS wants confirmation of the point of exit from the BBS system, a simple SR and message with "I took your number xxx" is all that is required.

... Hank

Subject: On email addresses and host names
To: ham-digital@ucsd.edu

Hank and Brian are having an argument over the right way to do host names and email addresses. From here, it looks like there's a fundamental disagreement over what the address _is_...

Hank, what Brian's thinking is that the email address _is_ the host name. That's the way it is on the Internet...it's user@host.domain. Even your hank@mentorg.com is nothing more than an aliased host name - there's a record (or possibly more than one, but the principle's the same) that says that mentorg.com is really some.host.mentorg.com. The sending host connects directly to the receiving host, sends the mail, and then the transaction's over. Since the Internet is fully connected, this works fine.

Brian, Hank's thinking that there are two possibilities in a store-and-forward, non-fully-connected network: Either have the email address not reflect the host name, and instead specify a hierarchical route, or else have each BBS contain a routing database - which, as was discovered early on in the Internet, is huge, inefficient, and always outdated. The DNS doesn't map well to a store-and-forward network. While the idea of a fully-connected AMPRnet is wonderful, it's a pipe dream for the foreseeable future, and we need something now. The packet BBS network isn't the Internet, and Internet solutions don't apply unchanged.

Now, can we at least talk on the same wavelength?

Hello Andrew. This message won't answere ur questions about mobile tcp-ip, but I wounld like to take this opputunity to ask u a couple of questions. First, I have been thinking of doing some traveling with an RV and I've pondered using packet as a way to send messages to some of my friends. Have u done much mobile packet? Secondly, how much of a pain in the @$$ is mobile packet? My thoughts always wonder to the frustrations built into local systems that I'm familiar with and i can't help thinking that the whole idea would be more work than it's worth. What do u think? Good luck on getting ur info. 73 de Bob AC6AV

>is the new kid on the block and potentially the next generation!!

Ted,

We've been using WNOS4 for some time at GB7SIG and had no problems until
we had a sudden increase in user activity. When the mail activity got
large WNOS could not cope. We tried the beta version of WNOS5 but this
seems to suffer from the same problem.

We are now trying to set up JNOS but are having lots!!! of trouble. Short
answer is, if its for your own BBS then WNOS4 is great. JNOS needs more work
to get the setup right. I have JNOS working at home but there seems to be
a problem with memory. The mailer does not work at present, probably because
of the lack of memory so watch this space.

I look forward to your comments and perhaps info from other areas.

Best regards & 73's

The previosuly posted instructions for accessing TAPR's list server
are incorrect. The proper address is "file-request@tapr.org". Don't
send file requests to tapr@tapr.org!

Mike Blackwell -- ke3ig -- mkb@cs.cmu.edu

Date: 9 Apr 94 18:29:49 GMT
From: news-mail-gateway@ucsd.edu
Subject: TAPR File server
To: ham-digital@ucsd.edu

It looks like I goofed in a message I sent out the other day. The file
server at TAPR can be reached at the address file-request@tapr.org. To
get the help file and a list of available files, send a message to

file-request@tapr.org

In the body of the message, type the lines:

help
dir
quit

The information will be sent to you. A reply-to line in your header will
help in cases where the return information is hard to decipher.

The address given previously, tapr@tapr.org goes to a human who will be
glad to take your orders or process membership applications, etc., but
cannot send you the requested files. This can only be done by the
file robot.

|>
|> I don't understand. There are fixed routes in and out of any full service
bbs.

Now I'm confused. How are these routes fixed? What happens when a
forwarding partner goes off air? What happens when a node goes down?
How are backup routes handled? I see "fixed routes" on a hour to hour
basis, but not on a year to year basis. Often, not even on a week to week basis.

|> The HF routes may seasonally change and require manual assistence.

|> operation. Will the bbs protocol work in this new arena?

Well ... the bbs authors don't care much - this is just data transport.
Bytes get from point A to pont B, not important how they get there.
i.e. it has nothing to do with the bbs protocol.

|> Maybe the answer is to make the 219 MHz DASH a tcp/ip network and put the

|> would like to see some more discussion on the future implementation of
|> this new network.

That is what we already do, but with other protocols: AX.25, NET/ROM,
CLOVER, AMTOR, PACTOR, whatever. tcp/ip as tranport protocol has not made
much inroad in the bbs network, for various reasons. It really does not
matter what transport protocol is used, the bbs system does not care.

|> Has anyone done any traffic analysis of bbs messages? Are the bulk of the

|> realize that I will be reading at 1200 for quite some time ... maybe 9600
|> if the bbs operators will provide this service.

Yes, much traffic analysis. The bulk of message traffic is "many hop".
At each increase in network capability to date, traffic has increased to
saturate the new capability within a short time. I already have users at
9600 baud, and they are asking for faster response ...

At least in the PNW, traffic has been running roughly equal volume (in
bytes) between personal and bulletins, with twice as many personal messages
as bulletins flowing through the system.

One thing to think about though: we have two different services represented
by the existing bbs network. There are single sender to single recipient
messages (e.g. personal messages) and also single sender to multiple
recipient messages (e.g. bulletins). We now tend to handle these messages
types a little differently - mostly by giving some priority to the personal
messages. Whatever transport mechanism we use will make little difference
to the day to day operation of a bbs system though - the messages will come
in, they will go out, users will send and read them.

: At least G-TOR only upshifts to 300-baud when it has enough data to
: justify it. It doesn't take up the wider bandwidth unless it needs to.
: I don't see anything wrong with taking up bandwidth as long as you're
: not wasting it.

Well, there are two problems. The first is that many radios have as
their available filter selections 2.1 kHz (or so) and 500 Hz. A
300-baud, 200-Hz-shift signal really needs a wider filter than 500 Hz.
So 300-baud operators (like existing HF packet ops) tend to use their
SSB filters. Then they can't tolerate interference on adjacent channels
because the interfering signals fall within their filter passbands, so
they space out to 2-kHz separation. In this case, these stations *are*
effectively taking up bandwidth that they aren't really using.

The second problem is that in an environment in which signals are not subbanded (if that's a word) by transmission mode, the use of signals of different widths make sharing the spectrum more difficult.

>email addresses. From here, it looks like there's a fundamental disagreement
>over what the address _is_...

I think Brian knows what an address _is_, and that's not a _name_.
The internet uses domain *names* that resolve to machine *addresses*
via nameservers. The name need not resemble the address. And the two
are often issued by two different responsible parties. The only requirement
on a name is that it be unique. In addition to being unique, the machine
address must conform to local network topology for routing purposes. The
packet BBS system uses hierarchial addresses that unfortunately resemble
internet *names*, but are *not* names. And that's the heart of the NTS
problem. NTS wants to send mail to named recipients for which there is
no unique name to machine address mapping system in place.

Example. I have priority traffic for the Director@Atlanta_Red_Cross.org.
There is no mechanism in place to resolve that name to the proper machine
address for delivery in the packet BBS system. The kludge has been zip
code routing. This has two failings. First it requires source routing
information from the sender. And second, there may be several BBSs
with overlapping coverage of that zip code. Each BBS has to maintain
network state tables pointing the proper direction for particular groups
of zip codes, and there's no *central authoritative control* over those
tables. Thus we get duplicated or misrouted messages.

hmmm...thanks for the info. I was not aware that the change was recommended by TAPR. My own experience was that a brand new 1270B (sans filters) would only copy about half the stations it could hear @1200baud while my older 1270, using the same radio and cables, had no problem copying ANY station.

Mebbe the 1270 "untwisted" the signal that the 1270B couldn't?

I am llooking for Z80 assembler source code for any
TAPR-2 compatible TNC. Ideally, I would like source for a TINY-2, but
a copy fo the code for real TAPR-2s would be OK. Any other TNC would
also be fine, as I am sure I could adapt to any eccenticit
!!*&&%^ eccentricities.
If you could get a phone number for a land-line BBS, callsign of a packet bbs
or domain information for an internet site from which we could do some
anaono
anonymous FTP, that would be great.

G-TOR and PBBS Use

I do have a G-TOR ROM in place and was able to test the mode.
In fact, the G-TOR interface provided by Kantronics is similar
enough to the Pactor interface that I can finagle a BBS connect
using the 1.17 MSYS release. NO, IT IS NOT SUPPORTED, I have to
"adjust" things for each connect but at least I can look at the
result of a connect.
This connect (from radios a few feet apart) showed 300 baud
operation. The mode is faster than Pactor, that is certain. It is
still HF, is does _not_ "scream".
Were I to have had it while camping this last week, things
would have been faster. Conditions to where I was located were
excellent and the 300 baud step would have been welcomed. To my
friends who connect to NO8M where 20 meter 200 baud operation is
normal, the 300 baud setting will be welcome.
The manual offers many more possibilities. The ARQBBS command
indicates that the KAM's internal mailbox can be set to be accessed
by AMTOR, G-TOR or Pactor, any one of the three. It might be
possible for MSYS to do the same. The GSCAN command allows the KAM
to be used like a Baycom modem. The KAM sends the binary mark and
space (1 or 0) to the computer who is supposed to sort it out.
Should that work with AMTOR, G-TOR and Pactor, a person trying to
connect could be initially seen here. Then the KAM could be told
to go to whatever mode would be appropriate for the bits and take
over the connect from there. Lots of overhead to this, though.
The TRACE command may allow us to look at what is happening so
perhaps that will allow some backwards engineering.
We keep running into two problems when supporting the KAM.
The first is documentation and the second is the cost.
Documentation is hard to come by. Were Host mode information
available, the KAM could probably be programmed dual port, too.
However, requests at Dayton and elsewhere indicate Kantronics is
not willing to support us. Perhaps this will change?
The costs are going up. As to whether it will be supported
.. upgrading from the KAM to the KAM+ was expensive enough.
Asking the author, WA8BXN, and the other beta testers to upgrade
every release may be a bit too much to ask.
There is a section in the new manual which is for "individuals
who have written Host mode programs" so someone is getting the
information. Any ideas how?

73,
Steve

Jay, what we're talking about is the gatewaying of messages between the two networks, not what the networks use internally.

The issue is how to transform one network's e-mail addresses (not host addresses necessarily) when mail crosses from one network to the other.

Frankly, I do not believe that the existing e-mail addresses used on the AX.25 BBS network will ever change. I do believe that a parallel network of internet-compatable ham radio mail servers will spring up and, over time, obsolete the AX.25 BBS systems.

The issue, for the moment, is how to make the two systems (the Internet and the existing AX.25 BBSs) interoperate as best they can.

jbloom@arrl.org (Jon Bloom (KE3Z)) wrote:
> ...My understanding is that G-TOR uses an extended Golay (24,12) code that
> is, in fact, invertible.

Yes correct. This code has the "code rate" of one-half (1/2) because each
user-information bit will be encoded in and occupy two bits on the channel.
The orginal post of the Pactor-2 promoter DL2FAK refers to convolutional
codes as being much more powerfull codes than Golay codes AND which cost
potentially less "overhead" bits for error-correction. This is not
necessarily true and depends on many parameters of the convolutional
code involved (coderate, constraint-length, etc.) as well as the
performance and capability of the decoder engaged in error-correction
decoding (hard- or softdecision, maximum-likelyhood/Viterbi- or sequential-
algorithms, etc.).

KE3Z:
> What G-TOR does is to send the data block,
> then if and only if an error occurred, it sends the Golay "parity" bits
> as a block. The receiving station can derive the data from either of
> these blocks if the block is correctly received. If it is not, the
> receiver can pass the two received blocks into the Golay decoder for an
> attempt at error correction.

Agreed. This scheme is called "Hybrid Type 1 ARQ" in the
literature on computer communication protocols: The frames on the channel
do not only carry user-information bits but a certain fraction of that
frame carries "redundant" bits (i.e. "Forward Error Correction (FEC)") which
allow the receiver to correct a certain amount of user-information bits
which were affected by noise or fading.
It is generally an easy step to augment the efficiency of such
Hybrid Type 1 ARQ systems (like G-TOR) by adding "memory" to the
protocol resulting in a so called "Memory Hybrid Type 1 ARQ" protocol.

["memory" in this context refers to the feature where bad frames are
not just thrown away but kept in memory and combined (in its simplest
form just added-up, i.e. linearly combined) with its repetitions. This can
be either done with harddecisions (-1s and +1s for binary 0s and 1s resp.)
or even better results will be achieved with softdecisions (for ex. 8-bit
quantized demodulator-output). This is what Pactor-2 promoters call
"analog-memory".]

KE3Z:
> This, I suspect, is a substantially more
> powerful scheme than memory ARQ, although I don't have good data on
> hand to back that up.

A scheme which combines both memory and error-correction codes
is even more powerfull. G-TOR as far as I know features only
the error-correction part and Pactor only the memory part of a
Memory Hybrid Type 1 ARQ protocol.

Or in other words: Pactor-1 could easily have been improved in its
(low signal-to-noise ratio) performance using error-correction
coding (and eventually bit-interleaving) as G-TOR now does.
It is important to realize that this could be done without
changing from cheap FSK to expensive PSK. This also means that
Pactor-1 is still far from an optimum FSK system, in contrast
to what DL2FAK is postulating in his conclusion:

DL2FAK:
: Pactor already represents nearly the optimum attributes that are obtainable with an
: FSK system.

DL2FAK:
: The most robust HF (short wave), narrow band, data transmission systems known,
: apply very powerful convolutional codes with Viterbi decoding and soft deci-
: sion (requiring an ADC/DSP just like analog Memory-ARQ). The processing speed
: of those systems exceeds the capability of a KAM by factor 100. Despite this
: very expensive approach, they only achieve around 10 dB better weak signal
: performance than PACTOR-1. The closer a system approaches the Shannon boundary
: (theoretical throughput limit) the more difficult it gets to gain another one
: or two decibels.

KE3Z:
> Perhaps, but 10-dB better in what environment? AWGN? That's not the
> environment of interest at HF. If the 10 dB figure is for a real-world
> environment, I'd be interested to see the reference it's from.

I know that the Pactor developers are aware of some specifications
of a (commercial) HF DSP-modem development here in Switzerland where I have
been involved the last 4 years; so I can give you an idea where DL2FAK
might have been taken from his hypotetic performance figures of 10 dB (and
eventually some design-ideas as well). That modem used a sophisticated
"Modified Hybrid Type 2 Memory ARQ" protocol based on convolutional codes and
a special QPSK modulation.
[Due to the current extremely low interest of the commercial
HF modem market in using such robust low-speed modems (adaptively 1 to 200 bit/s
user-data throughput) compared to high-speed HF modems (up to 2400 bit/s), the
managers stalled this developement about a year ago. They (managers) think
that we (engineers) developed an obsolete technology in the domain
of HF radio, which will anyhow soon disappear... ;-(
However, I hope that there will be an opportunity anywhere else to pursue
further research work in this field in the form of a Ph.D. thesis. It
would be nice to to prove that they (managers) were wrong ! :-)]

During the development, HF channel simulators were used to
optimize literally to the tenth (1/10th) of a dB signal-to-noise ratio
performance under different (fading) channel conditions. Just to give you an
idea: on a CCIR Poor channel (two equally-strong, fading

skywaves with 2 ms delay and fading rate of 1 Hz) with 4 kHz bandwidth
at an SNR of 0 dB, that DSP-modem provided a user-data (uncompressed) throughput
of about 70 bit/s. Clover yields about 35 bit/s and Pactor about 22 bit/s.

Said modem still transferred errorfree data (only at a few bit/s of course) at
less than -17 dB, whereas Clover times out at -3 dB and Pactor (and also Sitor)
at -8 dB.
Sitor achieves a throughput of 20 bit/s at a SNR of +3 dB; in order to
achieve that throughput, both Pactor and Clover need a SNR of -1 dB
(i.e. a 4 dB gain over Sitor) and the said modem only needs a SNR of -11 dB
which might be the hypotetical 10 dB gain figure claimed by DL2FAK.

However, Pactor-2 with the PTC-2 hardware will have a hard time to get close
this 10 dB gain figure due to its (still) too limited computing power for a full-blown
Hybrid Type 2 Memory ARQ protocol implementation in real-time.

DL2FAK:
: Actually G-TOR is just a modified PACTOR system, which probably does not pro-
: vide enough improvement that introducing this mode as another new standard
: would be worth-while. With regard to the basic requirements of each digital
: data transfer mode (like throughput, bandwidth, error rate, etc.) PACTOR al-
: ready represents nearly the optimum attributes that are obtainable with an FSK
: system. A real improvement over the current PACTOR system can only be reached
: when using different modulation schemes like PSK, which require a DSP hardware.

KE3Z:
> I'd say it's substantially more than a modified Pactor system! It uses
> different timing, different coding and a vastly different
> error-correction system. You might as well say Pactor is a modified
> AX.25!

I also consider them to be different systems because Pactor
is a Memory ARQ protocol which differs from AX.25 by its synchronous
timing and deletion of multiple channel access.
As pointed out above, G-TOR uses a Hybrid Type 1 ARQ protocol which
requires the use of error-correction coding and probably bit-interleaving;
however, G-TOR seems not to make use of memory (yet).

Pactor and G-TOR are similiar in that they both use "stop-and-wait" or
"idle-request" strategy if requests should be required.
AX.25 uses the "go-back-N" scheme where a certain number of frames
(i.e. as many as specified by the window-size) might be outstanding.
By the way, Clover is a Hybrid Type 1 ARQ protocol which uses a
"selective-repeat" scheme. I am not shure whether Clover is implementing
memory or not.

DL2FAK:
: This step will be done this year with the introduction of PACTOR Level-II.

KE3Z:
> It will be most interesting to see G-TOR and Pactor-II go head-to-head!
> May the best protocol win.

My feeling is that only those systems have a chance to win the favour of the HAM-community which completely disclose the protocol- and modulation-formats to the public domain (permitting experimentation, avoiding hassle with licensing, etc.). By current Swiss regulation, the use of non-disclosed proprietary systems by the amateur service is not permitted anyway.

If you like to dive deeper into the technology of protocols, the following reference is a good starting point:
S. Lin, D.J. Costello, M.J. Miller: "Automatic-Repeat-Request Error-Control Schemes, A survey of various ARQ and hybrid ARQ schemes and error detection using linear block codes", IEEE Communications Magazine, December 1984, Vol. 22, No. 12, p. 5-17. (Right, this is a quite old reference, but there is really nothing fundamentally new under the sun with the introduction of G-TOR, Pactor-2 or Clover. The satellite-communication links have employed such schemes for the last one or two decades...)

Intended to contibute to the discussion a few more facts and technical terms, not as an incentive for flames, wishing you vy 73s,

Rolf

To: ham-digital@ucsd.edu
Subject: FCC Packet Message Forwarding

In response to Jay's (KA9OKT) (jay@medicine.dmed.iupui.edu) proposal for user authentication -

>When this ham wants to send any message through my BBS, he would be required
>to place an authentification string at the bottom of the message. This string
>would be calculated based on the person's call sign, his private key, and
>the text of the message.

Donald D. Woelz says -

>Well, the only problem I see is that any station that can monitor
>the packet frequency can obtain the authentication string and then
>forge messages with that callsign.

My feeling is that because with Jay's proposal the text of the message would be one of the items used to generate the authenticator, that authenticator would only hold for that particular message, and so should help overcome the problem of replay of authenticator.

A good system for 'client' authentication already exists in the form of Kerberos from MIT. Perhaps we should see if a variant of Kerberos is appropriate for PBBS user authentication. After all, why re-invent the wheel.

Doug

I have uploaded a loader program for the TI DSK on
info-mac at sumex-aim.stanford.edu.

DSK_Loader 1.0

DSK_Loader is the Macintosh equivalent of the DOS program DSKL. With this
program you can communicate with the DSK (DSP Starter Kit) from Texas
Instruments. This program bootloads a simple communications kernel and then
loads other software using this kernel.

Other options are:

* Fill DSK memory with a certain value.
* Dump DSK memory into a textwindow, for further processing.
* Execute programs on the DSK.
* Graph output from the DSK.
* Act as a dumb terminal to the DSK.

The DSK and thus DSK_Loader is most interesting for people who want to
experiment with Digital Signal Processing at low costs.
For HAM-Radio operators it is a very interesting piece of equipment, Some
applications, like the KC7WW port of the W9GR filters are included.

: |> a rash of multiple NTS deliveries.

: This is a very serious problem.

: There are many possible causes, but they all come down to poor operating
: practices by the sysops. If the sysops had things set up reasonably,
: and made certain their systems were operating properly, then there would
: be no (zero, zilch, none) duplicated bulletins.

: Personal messages and NTS traffic are handled differently.
: Duplicates are allowed to occur, rather than lose an occasional message.
: However, these duplicates should be rare: 1 in 1000 perhaps.

I recently received 3 copies of one message and 2 copies of another.
This was out of a total of about 8 messages. A bit higher than 1 in
1000. Hank, I'm not trying to complain and attack the system. I'm
asking for help in making it work right. Don't assume that the bbs
systems are all working great and no fixes are needed. I don't
assume that the CW and SSB nts systems are working great, either. They
could both stand improving.

: Sounds like the sysops involved have not done a very good job of
: getting their systems to work.

: You can't just "Load the BBS software and away you go."
: It takes thought, planning, cooperation, and coordination to make a network
: work properly. In the past couple years, I have noticed a distinct lack of
: all of the above in many parts of the BBS network.
I agree. But most of the bbs's in this area 'just appear'. No one
asks if a new bbs is needed or wanted. Someone thinks it's a good
idea and puts it on the air.

: Perhaps time for some organization to take a leadership postion here?

I'm taking it on myself to send a return message back to the bbs where
a problem apparently occurred, describing what apparently happened.
Maybe the sysops can use the information to fix things. Like I
stated before: I get nts mail auto-forwarded into my KPC-3
mailbox. I read it with headers, and can see the forwarding paths,
plus the times. So if I keep copies off all the traffic, I can
see where and when the duplicates occurred and which bbs let it sit
for 5 days before forwarding it. So if you care to use the information,
you'll get it from me.

The authentication string would be calculated based on three items:

1. The call sign of the orignating station
2. The private key
3. The contents of the message.
==========

The BBS knows all three so it can verify the string. The private key is only known by the originating station and the BBS, so there would be no way to forge messages with a callsign unless you knew the private key.

You are correct that you could forge messages, but the message would have to be identical to a message previously sent, so there would be no point in doing so.

I guess the reason I sent the authentication message was to find out what was reasonable. Do I have to go through all those steps to authenticate someone? Can I assume if someone connects to my TNC, they are who they say they are? I don't want to lose my license because someone else typed something they weren't supposed to.

If my scheme was unreasonable (I agree it would be a pain to implement), what is reasonable authentication?

RSA & PGP would be OK, except they might be interpreted as illegal encryption.
I was trying to figure out a method that would work with text messages. My
scheme was kind of based on the PGP method.

Kerberos is a very good system, but it requires access to two systems (A host
and a key server). This might not be possible on packet. Somepeople are
lucky to be able to access one BBS, much less two different systems. If this
could be solved, I would be quite happy to use Kerberos.

|> network state tables pointing the proper direction for particular groups
|> of zip codes, and there's no *central authoritative control* over those
|> tables. Thus we get duplicated or misrouted messages.

I keep asking, but never seem to get any answer:

ARRL - How about taking a leadership postion here.

What is really wanted? How should it work?

We (the ham network community) need some standards (or best operating practices) developed. We (the BBS authors) need some information about how hams would like the network to work. "It's just software" and so can do whatever folks want it to do.

Just to stay on topic: most (probably all) of the BBS authors understand the name/location/route dichotomy fairly well. The real issue (as Brian pointed out) occurs at the interface between different networks. i.e. it is an internetworking issue, and not an intranetworking issue.

I hope the authors of email gateway code are paying attention.

1020. Wyse50/KPC-2 interfacing

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-04-11 19:13:11 UTC
From: taggartr@nic.ddn.mil
Message-ID: <9404111913.AA02411@nic.ddn.mil>
Source record: 49615

Packet folks,

I just picked up a Wyse 50 terminal from a coworker and have connected it to my Kantronics KPC-2 TNC. The terminal seems to communicate with the TNC at either 8N1 or 7E1 as long as the datarate is 9600.

The bad news is that the only time I get anything on the screen is when I'm connected to another station. When disconnected and in command mode, I get absolutely nothing. When I power up the TNC, I get no manufacturer's banner. No cmd prompt is displayed and when I issue a command, nothing that I type is displayed. Once I connect, then I get info on the screen although I still don't see what I'm typing. When I disconnect, all I get is ***D. I suspect the problem to be related to a command in the TNC but don't know which one.

If I set the terminal to HDX (half duplex), then I can see what I'm typing but get nothing on the screen after I connect. Tis a puzzlement. Your suggestions are solicited.

...

Some of the manufacturers support us authors fairly well, with information about new releases, requests for suggestions, and occasional alpha or beta hardware so we can test our code.

Some do not offer much of any support at all.

Kantronics falls into the first group: good support for the independent packet software author.

The above is my from my experience writing BBS code ...

For the curious: yes, I plan to support PACTOR and G-TOR.
Don't know how soon it will be ready though.

Whoa! If you're talking public key cryptography here, the private key should be known *only* by the originating station.

The public key is all that is required to determine if a "signed" document is authentic. *Everybody* can know the public key; it cannot be used to forge a "signature."

I compose a message. I "sign" that message using my private key. The message recipient (the BBS) verifies the signed message with my *public* key. If it passes verification, the recipient knows that it was indeed me who created the message. Authentication complete.

|> and the existing AX.25 BBSs) interoperate as best they can.
|> - Brian

Or perhaps the BBS network will support internet email addresses directly,
as well as the current "email address with those routing hints stuck in."

Since the domains do not overlap, it should not be a problem to handle
this, even with the existing software.

What I mean here is that it is no problem for me to arrange things such
that a message with an address of wa6fwi@wa6fwi.ampr.org heads for my local
email gateway. At present this cannot be extended to the general case
because of limitations on field and element length. These limitattions
are pretty artificial - they are an artifact of the CP/M systems we chose
initially as hosts ...

Making the changeover will not be all that big a deal. Some of the work has
already taken place: for example compressed batch forwarding is RFC-822
compliant, and there is no particular restriction on the To: / From:
fields.

I don't think we will see "parallel network ..." of servers, but rather see
the existing network of servers acquire more capability to internetwork,
when it makes sense for them to do so.

Would like to thank Brian for jumping into the discussion ...

It is probably time to get some more of these gateways running, but I see
very few of them, and the ones I can see directly (in the Portland and
Seattle areas) do not seem to move many messages between the tcp/ip world
and the larger interconnected BBS world. Seems to me this should be a
rather simple problem to solve, but it does not appear to have been solved
yet.

Current ham radio networks lack the bandwidth, and most ham stations
lack the computing power to do Kerberos.

I suspect you'll find that most of the cryptographic signature and/or
authentication systems can't be run inside a TNC.

Remember the primitive level of most ham stations. You'll probably have
to use some one-time-pad or equivalent paper-based authenticator scheme
if Joe Ham is going to use your system.

Sorry.

>RSA & PGP would be OK, except they might be interpreted as illegal encryption.

If you just want to make sure the message isn't forged, sign an MD5
checksum of the message with your RSA private key. Since no information
is hidden in such, it's clear that it isn't an illegal encryption.

If the MD5 checksum matches, the message is unaltered. If you were able
to decrypt the MD5 checksum in the first place, you're authenticated the
sender.

[Above scheme stolen from the MUSE project.]

Export and international issues are your problem to solve.

One would hope that hams would like the ham radio network to be interoperable with existing networks - such as the internet, which has more computers connected to it, and at least 10 times as many users of those systems, as there are hams in the world. Only the voice telephone system is a larger network.

I don't have a manual for the Wyse 50 to hand but I do know the Wyse 60
has a small 'quirk'. It will not receive and display data if the DCD
signal is OFF. This seems to align quite nicely with your problem!
I suggest you try wiring the interface cable so you have a permanent
DCD signal on your terminal (loop DTR or whatever).

Green Card Lottery 1994 May Be The Last One!
THE DEADLINE HAS BEEN ANNOUNCED.

The Green Card Lottery is a completely legal program giving away a certain annual allotment of Green Cards to persons born in certain countries. The lottery program was scheduled to continue on a permanent basis. However, recently, Senator Alan J Simpson introduced a bill into the U. S. Congress which could end any future lotteries. THE 1994 LOTTERY IS SCHEDULED TO TAKE PLACE SOON, BUT IT MAY BE THE VERY LAST ONE.

PERSONS BORN IN MOST COUNTRIES QUALIFY, MANY FOR FIRST TIME.

The only countries NOT qualifying are: Mexico; India; P.R. China; Taiwan, Philippines, North Korea, Canada, United Kingdom (except Northern Ireland), Jamaica, Domican Republic, El Salvador and Vietnam.

Lottery registration will take place soon. 55,000 Green Cards will be given to those who register correctly. NO JOB IS REQUIRED.

THERE IS A STRICT JUNE DEADLINE. THE TIME TO START IS NOW!!

For FREE information via Email, send request to cslaw@indirect.com

Does anyone have any experience of sending TCP/IP traffic between
the UK and the USA over the "LONNY" link (i.e. the link between
the NBC (?) offices in New York and London) ?

Can it be done at all?
If so, is the link usuable for 'real-time' traffic, or is it only
suitable for mail transfer etc ?

Gateways to different name spaces have existed for years on the internet
without causing death and destruction. In the past to send mail to folks
at Digital Equipemtn Corporation, the mail had to be addressed via
decwrl.dec.com. That ONE machine had to be able to handle the crossover,
not the whole net. A possible approach to this in the AX.25 world would
be:

N1JEB%KA1SRD.MA@gateway.ampr.org

Or

dts%world.std.com@KZ1XXX.MA.US

The gateway machines would have to handle recognition of the different
address formats, but no others should have to. Note that the % signs are
used for addresses that are not to be looked at until through a gateway.
this is in the RFCs for the internet. It might make sense to have the
packet network leverage some of the networking expertise which can be
garneredfrom the many years of standards activity in the internet
community.

While your system will work, there are two authentication systems
already in use. One is for smart programs at each end and the other is
for manual users. Why not use them instead of inventing something new?

>I think one of the major problems of our current packet system is that

I think you are wrong on the repeater. If you operate a repeater and
someone is CONTINUALLY using it in an unlawful manner, you are expected
to take steps to prevent this.

Similarly, the FCC rule leaves room for common sense. If you were to
put in place a methodology of random sampling of messages, you could
argue that you are exercising control in a manner consistent with the
rules.

Given all of this, the next beta version of AA4RE BBS (2.1R) which will
be within a week or so contains the ability to hold messages (either
private or bulletins or both) from local users which haven't
authenticated themselves. AA4RE BBS already supports a manual
authentication system modeled after the NETROM implementation and some
commands suitable for use another BBS or a smart terminal program. In
fact, BBS-to-BBS authentication is already in place and a standard has
been published.

Continent codes were an attempt to further simplify the routing tables.
A station in the USA might send ASIA one way and EURO the other. Small
tables are important for the many systems still running on the 8088
based systems (XT, etc).

Is there any good way to tell what SSTV mode a SSTV transmission is using? I tried decoding SSTV from 20 meters using JVFAX 6.0. It can decode several SSTV modes, but the closest I was able to get was a picture with the three color images offset from each other.

Any ideas?

Thanks...Jim

[stuff deleted]
: If I set the terminal to HDX (half duplex), then I can see what I'm typing
: but get nothing on the screen after I connect. Tis a puzzlement. Your
: suggestions are solicited.

You need to RTFM to see how to get your tnc to echo. Putting the terminal
into HDX makes it truly do HDX (drop RTS after sending what you typed so the
half-duplex modem you've told it you have can transmit back to you). Sadly,
your tnc (if I recall correctly) needs that RTS line high to know that it's
OK to send to you.

So, you need your terminal in FDX, and to get your tnc to echo.

Yes, it's clear that the *technology* to authenticate messages exists (ignoring folks who go to the head leaving their terminal logged in, i.e.; most of us). My question was what does the FCC mean by "authentication" in their text. What is acceptible to them? Does the FCC believe that digital signatures work?

(Note that even if you use the original RSA signature scheme of encrypting the entire message with your private key, the purpose isn't to obscure the content, so you are probably safe. Since it can be decrypted with your public key, you should be really safe. Even more if you append your public key to the message.)

It is my understanding that the encryption only has to be the "signature"
not the body of the message. No sense in getting the "I can't copy on my
Model 15 types more upset about things than normal.

Message-ID: <1994Apr13.032237.3094@gsm001.mendelson.com>
Source record: 49545

Pardon me for being vague, but I was talking to a ham who purchased an MFJ TNC that plugs into his Commodore 64. It is supposed to use "public domain" software. It did not come with any software :-(

I don't think this is a regular TNC with an rs232 to ttl converter, but a small circuit card with an edge connector unique to the C64. Based on the price I expect that it is only a modem. The packet assembly/disasembly/AX.25 processing is done in the C64.

He does not have access to the Internet nor packet.

I have looked in both the C64 archives at U. Waterloo and at the ham radio archives at oak.oakland.edu. I could not find anything appropriate.

Does anyone know what software to use? If you do where do I get it? (file names too please) Once I get it how, do I get it onto a C64 Disk?

Thanks for your time and trouble.

73,

Geoff.

About a week ago I posted a query re:

Is KA9Q NOS Telnet virtual terminal definition correct?

Thank you to a number of people who wrote me directly or posted followups to my query.

Unfortunately I was unable to keep up with news this week and I found that two followups, from hammock and dave, were still listed in my news server database but expired before I had a chance to read them. Would these people be kind enough to mail me their comments?

As to the problem of KA9Q NOS behavior, at this point I am convinced that the end-of-line handling problem is in the telnet server part of the Minix TCP/IP implementation and not in NOS. Another user has offered me a patch that I hope will resolve the problem.

In a separate post I asked about some other problems I had with NOS dropping the first character on a line and having trouble handling large amounts of quickly-arriving data from a large host. I haven't received any replies on these queries and I would like again to ask for help on understanding and possibly dealing with these problems.

>Remember the primitive level of most ham stations.

This reminds me... Someone, a few posts back, made the comment that most packet bbs stations now sport at least a 486 computer with several hundred megabytes of hard drive. I would like to dispute that comment. Yes, there are some systems like that. And, the number is on the increase. But, I doubt that even half of them are. Remember, there are many people still getting along quite well on an XT class machine.

Until last weekend, my XT with 40m HD was my main board, running FBB, SAM, BPQ, and several ports. I was finally able to upgrade my "office" computer to a 386 and took the 286 back to the shack to replace the XT. The 286 is more than enough computer to handle the job and is quite fast. I would hate to see the day that we had to have other than a minimal computer to handle bbs software.

Oops! If you use the public key in the message to authenticate the message, you can be fooled easily. You will know that the message was signed by the private key corresponding to that public key. You won't know that the keys belong to anybody in particular.

In order for digital signatures to work, the public keys must be distributed by a trusted mechanism (which is NOT a chicken-and-egg problem, BTW -- there are several schemes to "bootstrap" the trust).

|>
|> Sorry.
|> - Brian

I suspect most BBS systems run on minimum 386 today, and many, at least
one per major area, run a fast 486 or even P5.

So the authentication using various schemes is certainly possible.

Note that what is actually required is to verify that the station
connected to the BBS is actually who they say they are: i.e. that
the connect to the BBS was done by the holder of the callsign.

There are many schemes that can provide this verification at high
level of certainty, without requiring any more processing than
a Z-80 can provide.

Providing authentication for the contents of a message is a different
issue. Do we need to address this also? My reading of the rules says we
do not.

|> - Brian

And if you want to do this with less processing time, use MD4 or even MD2.
Brain, ka2bqe, has an MD5 implementation running with compressed batch
forwarding, not for verification purposes, but to allow better error
detection.

In the longer run, the ham digital network is certainly moving toward the
use of these existing standards. The use of RSA plus MD5 makes a lot of
sense.

1059. 486cpu RFI Problems

Newsgroup: rec.radio.amateur.digital.misc
Date: 1994-04-13 18:35:55 UTC
From: cottle@prism.sps.mot.com
Message-ID: <1994Apr13.183555.17249@newsgate.sps.mot.com>
Source record: 49552

I have been trying to set up a packet station, and have
experienced problems due to a LOT of noise emitted by my
PC. I thought those devices were supposed to be relatively
shielded, but even with an external antenna, my HT pickes
up a lot of noise, which makes squelch settings, etc.
difficult.

Does anyone know of a way to quiet the environment down
to make it more acceptable to Ham. I have tried different
ac outlets but it makes no difference.

Thanks

The current "standard" for Baudot RTTY and AMTOR is 170 Hz shift. However,
PACTOR uses 200 Hz (or at least that is what the German spec calls for).
I think that you will find that either shift will work fine.

In most cases I suspect the people making the claims are thinking
bulletins should be more like NNTP and the Usenet NEWS system and
mail should use RFC-822 formatting and SMTP. (Both NNTP and SMTP can
be carried over other things than TCP/IP.)

There is a good case for this as it would make interoperability with
the Internet *much* easier however SMTP especially is not really suited
to the chaotic Packet BBS network. NNTP could work quite well though.

Actually, NNTP and POP3 could be good specifications to include in
BBSs for non-interactive client sessions (similar to using TPK for example).
It would need the creation of client software to handle this over
a standard AX.25 link. That shouldn't be too hard.

Carl.

Not sure why you would have problems with the KAM host
mode, when I bought my KAM a year it included the full
documentation on the Kantronics Host Mode. I am not sure
if they are still doing this with the KAM Plus though.

The host that is used is a modified KISS protocol
with each frame starting with a FEND character and ending in
FEND character. ETC ETC.

When I have questions on the protocol I give Kantronics a call
and they have been more than willing to help me out getting
the information that I need. Not sure what the problem is?

The Information is out there!!

Hello.
I would like to begin in packet with a cheap modem. So, I was quite interested
in the Baycom modem which can be bought as a kit, but it seems that most of the
decoding is done in software. So my question is : is this software available
for other computers than PCs. To be really specific, I have an Atari Falcon.

Thanks for any idea, 73 !

Vincent.

Common problem. Computers have to meet Class B radiation specs, but that isn't really that quiet when near such an ultra-sensitive receiver as is in a HT (too sensitive in most cases which is why they suffer so much from overload and intermod, but that's another thread).

The cure is the usual round of shielding and suppressing, with the additional fillip with a HT that its plastic case is also a lousy shield.

The easy part is usually the PC. First start by scraping the paint off of all seams where case parts join so as to get a good electrical connection. Use lots of screws to bond the case together. Typical VHF practice is at least one screw for every two inches of seam. Any openings in the case should be screened with copper screening. The TNC should receive the same treatment since they are usually radiators too.

The monitor is usually the worst culprit. Its case needs to be screened since they're usually plastic. There are conductive sprays on the market that work well for this. Usually you'll want to spray the inside of the case for cosmetic reasons. Be careful that any areas of the case that will be close to the HV sections of the monitor are protected by fish paper so that you'll get no flashovers to the now conductive case. If the monitor is color, you should be done since the shadow mask in the CRT makes a good RF shield. However, if the monitor is mono, you may need to put copper screening over the face of the tube. This can serve double duty as a glare shield so its not so bad.

Then there's the keyboard. These things have microprocessors in them too, and spray scan code everywhere across the board to scan for keypresses. These can be real bears to quiet. Try the conductive spray on the plastic case, and also tack in bypass caps on the scan lines. You may have to try different keyboards to find one you can quiet.

The HT is likely to need additional shielding as well to prevent signals from entering through the case. The conductive spray works here too, or you can put the HT in a shielded metal box. A good input bandpass filter in the antenna lead can help too.

Of course *all* interconnecting cabling must be shielded, and in addition, ferrite cores should be placed around cables. This chokes off common mode currents that may be flowing on the shields.

In stubborn cases, you may want to relocate the HT to the antenna area and run long shielded and choked AF cables back to the TNC. Getting the too sensitive HT further from the source of computer hash is a very powerful technique to reduce interference. (Or, you could buy a *real* radio, but again that's another thread.)

Congrats on the new ticket, the fun is just beginning.

|>
|> I believe I'll need the following.
|>
|> PC compatible that will emulate a terminal with a program such as
|> procomm.

Actually, the bare minimum requirement is only an RS-232 dumb terminal that connects to the RS-232 port on the TNC but I must admit that I don't know any one running in this mode. Any PC will do. Any serial port communications program will do - that's personal preference. I run the program that came in the TNC package. It's not great but it gets the job done.

|>
|> Some brand of TNC, to do the traffic handling.

There seem to be a couple dozen brands out there so I guess you have to decide how much $$$ you want to part with. I bought the MFJ type mostly since I didn't want to spend more than $150 for the entire packet setup; I already had the radio and computer. It works well enough is about all I can say about MFJ since I haven't had hands-on experience with other brands.

If you don't subscribe to QST or CQ magazines go down to the library and check out the TNC ads. They range from boxes that will only do packet to those that send and receive weather satellite photos. Check out the books for sale ads also from the ARRL - they offer a few packet books available by mail.

The ARRL has an on-line help system accessible via internet. Send a mail message to info@arrl.org with a one line text of help and you will get the help file back that describes how to use the rest of the features. There's quite a few packet files available via this service along with hundreds of other ham related files.

|>
|> I've got a couple of 2m FM rigs,and a 5/8 wave vertical. Anyone care to
|> explain the details ?

Since this posting is coming from Chicago, I don't know the CA packet freqs. Most of those around here at least are in the 144.9 through 145.7 range. You probably just have to tune around until you hear some strong 1200 baud buzzes and then try connecting to those stations. When you connect to the on-the-air BBS systems they have on-line help prompts to guide you along. The average 2M rig and a vertical is the only RF hardware you will need to get started.

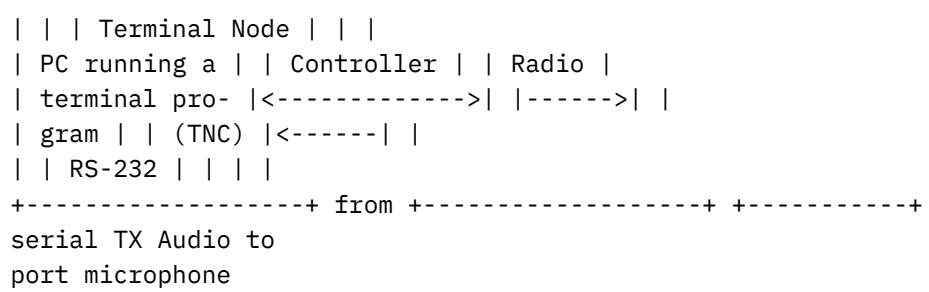
You've probably guessed that the basic system looks like this. The TNC you buy will hopefully come with detailed instructions showing how to hook up their brand. The MFJ stuff comes with 3 manuals of "how to do it."



This is only the beginning...feel free to e-mail, etc. if you have any questions.

John Maenpaa WB9JEJ
maenpaj@rtsg.mot.com

If Motorola wanted me to speak for them, they would be paying me for posting this.

This is a non-problem. Since the person is authenticated, the FCC knows
who originated the message. Unless you have been accepting several of
these "NAL-able" messages from the same person, you can not be held
responsible for someone going off unexpectedly. The whole idea behind
authentication is to be able to prove (reasonably) who really sent a
"bad" message. The bit with holding the first forwarding station
responsible is the "incentive" for doing the authentication.

|> Common problem. Computers have to meet Class B radiation specs...

It is true that the law is that all computers sold for home use must meet FCC class B in the US. Other standards exist in other countries. But with the explosion of the "build-it-yourself" computer stores. I have found that most (if not all) of these stores do no testing of the completed systems. The FCC does not like this problem, but with current staff they have no way to shut these guys down. I doubt that the computer in question meets FCC class B.

A lot of good ideas deleted :-) to save space.

I worked in the PC industry for 7 years and wrote the chapter on EMI suppression for computers in the ARRL RFI book. This chapter works to solve this problem of EMI loud computers. Pretty cheap at $10 or $15, I think :-)

Good luck!

Phil

DE KJ6NN

P.S. I get no "royalty" when this book sells. I wrote to help hams... Enjoy!

Is it going to be possible to crank public key encryption in the Z80s which
inhabit most TNCs? Remember that many TNCs are run connected to just a
terminal, etc. A personal computer, workstation, etc. is optional in the
current scheme of things with packet, and that has advantages in many
applications!

SB PBBS@AMSAT $ARTS-094
AMSAT PBBS MOVE

The AMSAT PBBS will be changing frequency and modes starting April
15th at 1600 UTC. The AMSAT PBBS will be on a Mark freqeuncy of 14.079,
that's (14.181.1 AFSK LSB), using the mode Pactor with the callsign WT0N.
The new schedule will be as follows: Monday THRU Saturday from 1600 UTC
until 2300 UTC on a Mark freqeuncy of 14.079. From 2330 UTC until 0400 UTC
on a Mark freqeuncy of 7.073.5 that's (7.075.6 AFSK LSB), using the Mode
Pactor. These changes have been made to better serve AMSAT users with better
coverage and use of a mode that many of the users have expressed an interest
in. If anyone would like to use the Mode G-TOR, please let me know and I
can see about setting up a schedule for G-TOR users. Please send any
comments or suggestions to one of the following:
INTERNET: BJARTS@STTHOMAS.EDU
PACKET: WT0N@WB0GDB.#STP.MN.USA.NOAM
PACTOR: WT0N

The AMSAT PBBS will have updated Keps and AMSAT BULLETINS, along with
SpaceNews and other satellite related items.

73 AND THANKS FOR YOUR TIME AND INTEREST THE AMATEUR SATELLTIE PROGRAM

Actually, some of us think that BBSs should ONLY handle MAIL, with
'bulletins' and advertisements broadcast in round-robin using something
akin to the PACSAT broadcast protocol.

: of the lack of memory so watch this space.

We've been running JNOS around this area for a year or more. Sure there's
bugs (like ALL nos's) but no where near the troubles you allude to.

We run JNOS110B right at the moment. We added a bunch of features for our
own system like a NetROM matrix cts/rts scheme and a enhanced convers.

*** Flame mode on:

So what should I do to try and help? Spell it out and stop whining.

I guess differently than you do: I am trying to help by working to create
a network that will gaurantee error free movement of messages
anyplace in the world.

Did I say "none at all"? No I did not.
Please pay attention and read what was written (it's right up there ..).
I said that 80M CW sounds terribly inefficient and error prone.

Your response is what I hear from the majority of hams presently involved
in NTS: "Oh my, Oh my, Run Away! - the Computers are coming, and we are
afraid they will replace us!"

In what way would you like me to help? By getting on 80M CW?
No thanks, I've done that, and know perfectly well that it is error prone, slow, and can handle only a tiny amount of traffic.

What I have been saying is that NTS fails to make use of all resources available to it, and in particular appears to be stuck in the dark ages of message handling.

"End of discussion" sounds a lot like "I refuse to hear what you have to say, and will continue to refuse to hear it."

*** Flame mode off:

Indeed, not all NTS participants are like Mike.

Some appear to understand what *could* be done, and would like to move NTS forward. However from my experience they are in the minority, and the "Mikes of the world" are in the majority.

No, it is a different code. You can get an EPROM with the latest
code, and the docs of course, from TAPR. I used it some time ago,
and it works just fine. Of course the interface is designed to be
computer rather than human friendly, and I have always been strange.:)
My only complaint is that there is/was no version with KISS in it.

Probably the biggest factor is to have a computer that is FCC type B approved for RFI. Type B is the more stringent standard.

Type A is not approved for use in the home or for sale for home use.

I spelled it out several times in previous postings, but you didn't
respond except to attack CW as a means of traffic handling. Another
poster did answer my questions and said that what I thought would
help CAN be done. Tell me what needs to be done to stop doubling,
tripling, or even more of messages. Tell me what needs to be done
to get the time from filing down from 5 to 10 days to something
reasonable. Don't tell me the above statements are not true. I'm
keeping track of the header information on the messages I deliver
that travelled by packet and the 5 to 10 days is the norm/.
